Content Management Systems

Drupal – Introduction, Technical requirements

P Sreenivas

Department of Computer Applications

Content Management Systems

Drupal

- Drupal is content management software. It's used to make many of the websites and applications you use every day.
- Drupal has great standard features, like easy content authoring, reliable performance, and excellent security.
- But what sets it apart is its flexibility; modularity is one of its core principles. Its tools help you build the versatile, structured content that dynamic web experiences need.

Content Management Systems

Drupal

- It's also a great choice for creating integrated digital frameworks. You can extend it with any one, or many, of thousands of add-ons. Modules expand Drupal's functionality.
- Themes let you customize your content's presentation. Distributions are packaged Drupal bundles you can use as starter-kits.
- Mix and match these components to enhance Drupal's core abilities.

Content Management Systems

Drupal

- Drupal is written in PHP programming language
- The Drupal project is open source software. Anyone can download, use, work on, and share it with others.
- It's built on principles like collaboration, globalism, and innovation. It's distributed under the terms of the [GNU General Public License](#) (GPL)

Content Management Systems

Drupal

- Organizations of all sizes — across industries and worldwide — use Drupal not only to build corporate websites but to build and manage e-commerce sites, mobile applications, digital signage, social networking sites, intranets, portals, microsites, resource directories, kiosks, and more.

Content Management Systems

Drupal – a brief history

As an undergrad at the University of Antwerp, [Dries Buytaert](#) created Drupal as a message board in 2000, releasing it as an open source project a year later. This invited others to shape the platform to their needs and grow the Drupal community.

Content Management Systems

Drupal – a brief history

Dries meant to introduce the software as “dorp,” the Dutch word for “village,” which got at the importance of community, a prevailing value of open source. He mistyped it as “drop.org,” though, which evolved to “Drupal” — because “druppel” is Dutch for the English word “drop.”

Content Management Systems

Drupal – a brief history

Drupal took off in 2003, when supporters of U.S. presidential nominee Howard Dean created a digital platform that featured blogs, calendars, and forums that supporters used to establish advocacy groups.

Content Management Systems

Drupal – a brief history

The software continued to gain traction among developers and enthusiasts, but it wasn't until 2007, when MTV reached out to Dries, that he realized that he could create a company to support Drupal's development. He partnered with Jay Batson that year to start Acquia. Today, Acquia is the top corporate contributor to Drupal development.

Content Management Systems

Drupal

- The current standard version of Drupal is Drupal 11.
- Drupal 11 makes structured content, workflows, and content governance more flexible and easier for ambitious builders

Content Management Systems

Drupal

Today what is Drupal used for???

Like any CMS, Drupal helps users structure and manage their content. People can use it to build websites or web applications, as well as integrate it with many third-party sites and services.

Content Management Systems

Drupal

Today, Drupal has more than 51,000 modules that extend its functionality in areas such as content scheduling, auto URL aliasing, and tokenization. There are also hundreds of integrations for applications like Mailchimp, Apache Solr, and the Salesforce suite.

Content Management Systems

Applications that integrate with Drupal

yoast

GIGYA

shopify

Content Management Systems

Drupal

Yoast is a plug-in tool for SEO used in Wordpress and Drupal.

Gigya is Customer Data platform solutions tool from SAD uses Drupal.

Lingotek is a language translation Management and localization tool using Drupal as CMS.

Mautic is a open source marketing communication tool –uses Drupal.

Hubspot provides free CRM tools and Software uses Drupal as CMS

Content Management Systems

Drupal

Drupal powers more than 1.7 million websites. In fact, of the top 10,000 websites, roughly 10% are built on Drupal. They appear in all sectors, including:

Entertainment (Sega, Warner Music Company)

Financial services (Nasdaq)

Food and Services (DavidsTea, Sodexo)

Government (Government of Australia, Government of India, Government of South Africa)

High tech and Telecom (AMD, IBM, Panasonic, Verizon, Vodafone)

Higher Education (Princeton University, Oxford University)

Media and publishing (Economist.com, India Today)

Travel and Hospitality (Central Hotels and Resorts, Japan Airlines)

Content Management Systems

Drupal

Why Drupal is so popular???

- Ease-of-use

- Content hub for web, mobile, and more

- Powerful editorial digital management tools

- Performance and scalability

- Multilingual

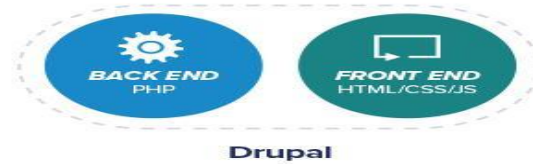

- Security through transparency

<https://www.youtube.com/watch?v=cKi1d0ErDt0&t=57s>

Content Management Systems

Drupal - Architecture

Unified Architecture

Decoupled Architecture

Hybrid Architecture

Content Management Systems

Drupal

Who uses Drupal???

It's a platform for many government agencies in USA, London, France

It's the framework media companies like BBC, NBC, and MTV UK rely on to inform and entertain the world.

Content Management Systems

Quiz

What type of software is Drupal?

- a. Content management Software
- b. Programming language
- c. Database management software
- d. Scripting language

Ans. a

Content Management Systems

Quiz

In which language Drupal is written?

- a. Java
- b. PHP
- c. Perl
- d. Go Lang

Ans. b

Content Management Systems

Quiz

Who developed Drupal?

- a. James Gosling
- b. David Ritchie
- c. Kernighan Ritchie
- d. Dries Buytaert

Ans. d

Content Management Systems

Drupal – Installation

P Sreenivas

Department of Computer Applications

Technical requirements to install Drupal

- a. PHP 8.1 or higher
- b. Docker and DDEV installed on your machine
- c. Composer, the PHP package management tool
- d. Docker for running local environments
- e. An editor, such as Visual Studio code or phpStorm

Installing Drupal on Windows for local usage

When developing and running Drupal, you need a so-called AMP stack. AMP stands for "Apache, PHP & MySQL", but other web servers may be used instead of Apache, and other database servers may be used instead of MySQL.

Content Management Systems

Drupal

Install the composer

Important note

Go to the Composer documentation to learn how to install Composer globally on your system.

Linux/Unix/macOS: `https://getcomposer.org/doc/00-intro.md#installation-linux-unix-osx`

Windows: `https://getcomposer.org/doc/00-intro.md#installation-windows`

Creating a Drupal Site

Create a new Drupal site using the Composer project template and run the Quick Start command to create a preview site. The instructions provided in this section are based on the recommended installation instructions at <https://www.drupal.org/download>.

Content Management Systems

Drupal

Drupal also requires several PHP extensions. These are typically available with most PHP distributions. The up-to-date list of required PHP extensions can be found online: <https://www.drupal.org/docs/system-requirements/php-requirements#extensions>.

Content Management Systems

Drupal

How to do it...

1. Open a terminal and navigate where you would like to create your new Drupal site.
2. Use the create-project command to create a new Drupal site in the mysite directory:

```
composer create-project drupal/recommended-project mysite
```

3. Move into the newly created mysite directory, which contains the Drupal site's code base:

```
cd mysite
```

Content Management Systems

Drupal

4. Run the Quick Start command to install a sample Drupal site using the Umami Maganize demo:

```
php web/core/scripts/drupal quick-start demo_umami
```

5. Once the installation script has finished, your browser will open your Drupal site. If your browser does not open, a login link will be printed in the terminal

Drupal

```
php web/core/scripts/drupal quick-start demo_umami
```

- * docs: https://www.drupal.org/docs/user_guide/en/index.html
- * chat: <https://www.drupal.org/node/314178>

Congratulations, you've installed the Drupal codebase from the drupal/recommended-project template!

Next steps:

- * Install the site: <https://www.drupal.org/docs/8/install>
- * Read the user guide: https://www.drupal.org/docs/user_guide/en/index.html
- * Get support: <https://www.drupal.org/support>
- * Get involved with the Drupal community:
<https://www.drupal.org/getting-involved>
- * Remove the plugin that prints this message:
composer remove drupal/core-project-message
- * Homepage: <https://www.drupal.org/project/drupal>
- * Support:
 - * docs: https://www.drupal.org/docs/user_guide/en/index.html
 - * chat: <https://www.drupal.org/node/314178>

```
+ Sites cd mysite
+ mysite php web/core/scripts/drupal quick-start demo_umami
17/17 [ ]
Congratulations, you installed Drupal!
Username: admin
Password: _DSrscTusbZPIE7o
Drupal development server started: <http://127.0.0.1:8888>
This server is not meant for production use.
One time login url: <http://127.0.0.1:8888/en/user/reset/1/1639020385/eroPjnZikbuL69I36MQSPCycUtlCgpnWz_wHH82U1D4/login>
Press Ctrl-C to quit the Drupal development server.
```

Figure 1.1 – Output from running the Quick Start command

Content Management Systems

Drupal

6. Press Ctrl + C to exit the Quick Start server at any time.
7. Next, open `web/sites/default/settings.php` in your editor. We will modify this file to modify the configuration synchronization directory and add local setting overrides.
8. Set the configuration synchronization directory (where Drupal's site configuration can be exported) to `../config`. The path is relative to the web directory.

Content Management Systems

Drupal

The installer from the Quick Start command will have generated a default value. At the bottom of your file, find a line similar to the following

```
$settings['config_sync_directory'] =  
  'sites/default/files/config....';
```

Replace it with the following line:

```
$settings['config_sync_directory'] = '../config';
```

This ensures your exported Drupal configuration is not within the web document root folder

Content Management Systems

Drupal

9. At the bottom of your file, add the following snippet of code to allow the creation of a settings.local.php file to override the settings in the settings.php file in different environments:

```
/**
 * Include local environment overrides.
 */
if (file_exists($app_root . '/' . $site_path .
    '/settings.local.php')) {
    include $app_root . '/' . $site_path .
        '/settings.local.php';
}
```

This checks whether there is also a `settings.local.php` file alongside your `settings.php` file and includes it if it exists. By using local settings files, you can add sensible defaults to your Drupal settings file but have per-environment configurations and database connection settings.

10. With that, you have set up a Drupal code base and a sample development site that we will use throughout

Content Management Systems

Installation of Drupal on localhost using XAMPP

For running Drupal on your local host first you need to install the XAMPP server to your computer XAMPP makes your computer like the server.

Content Management Systems

Installation of Drupal on localhost using XAMPP

Steps to install Drupal:

Step 1: Go to the Drupal official website and download its latest version from the website. (www.drupal.org)

Content Management Systems

Installation of Drupal on localhost using XAMPP

```
composer create-project drupal/recommended-project drupal  
cd drupal && php -d memory_limit=256M web/core/scripts/drupal quick-start demo_umami
```

More options in the [quickstart docs](#), and on how to start your site using composer.

Want to download Drupal without Composer?

Composer is the recommended method for using Drupal, but you can download Drupal directly and use it with Composer later.

[Download Drupal | .zip](#)

[Download Drupal | tar.gz](#)

 drupal-9.4.9.zip

Content Management Systems

Installation of Drupal on localhost using XAMPP

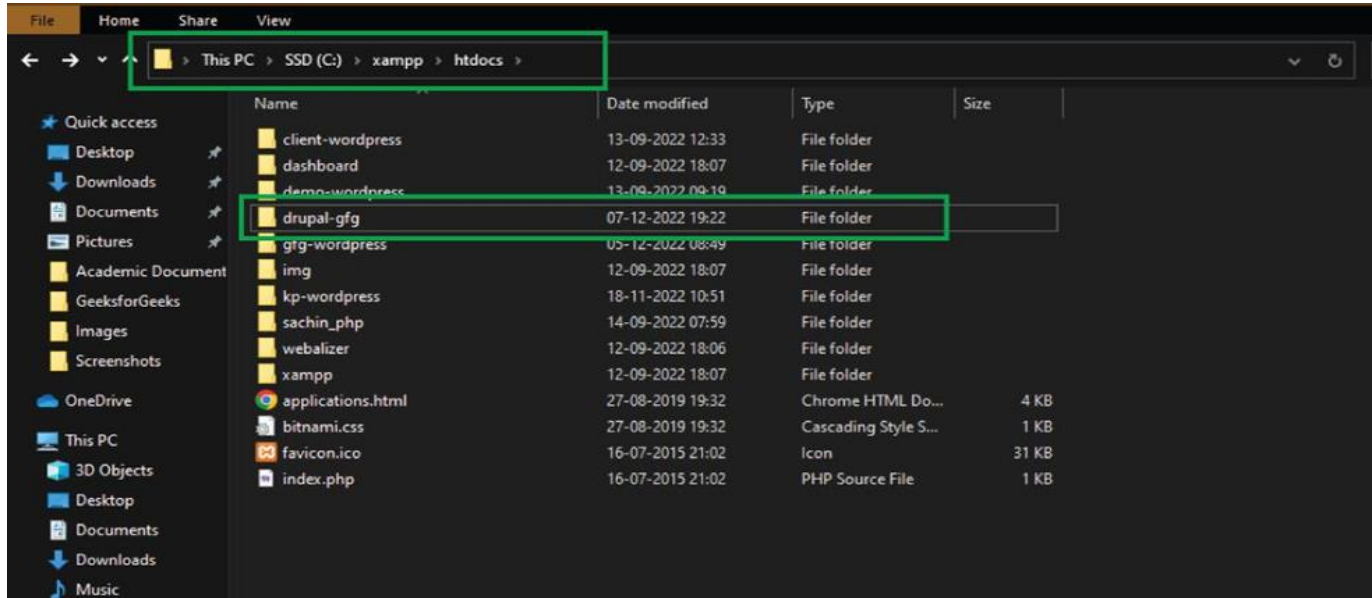

Step 2: Extract the zip file which you have downloaded (Drupal 10)

Content Management Systems

Installation of Drupal on localhost using XAMPP

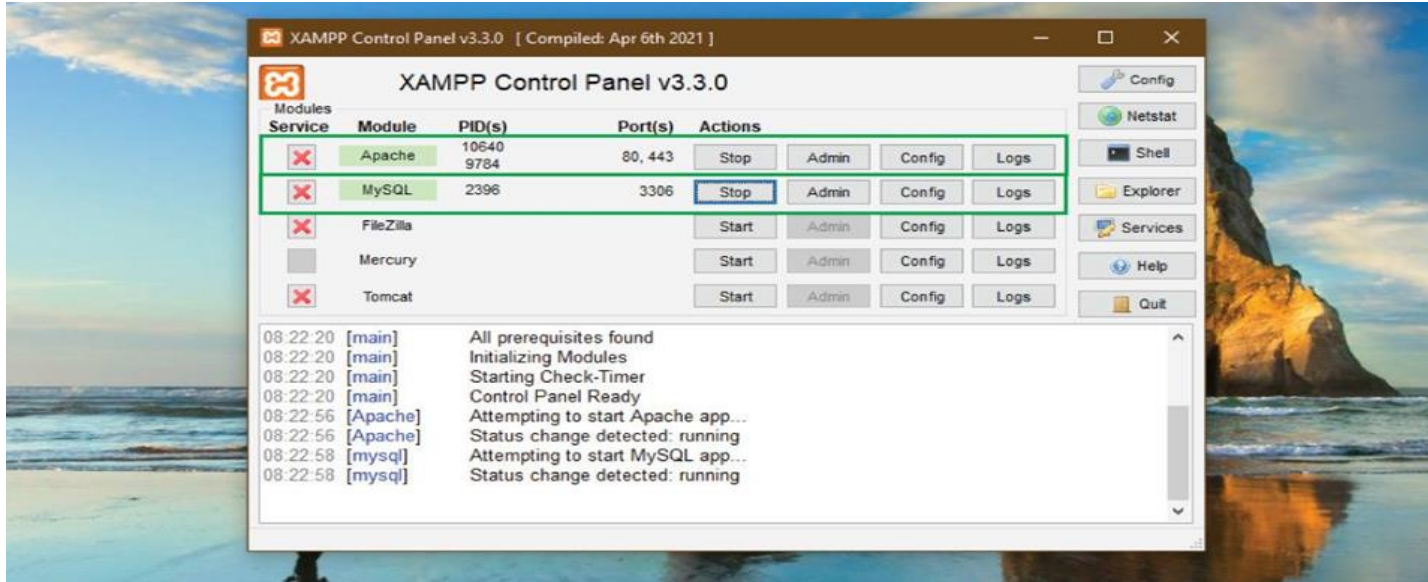

Step 3: Now copy the extracted file of the Drupal zip file and paste it into the xampp > htdocs file. For convenience, we rename the extracted file as “drupal-gfg”.

Content Management Systems

Installation of Drupal on localhost using XAMPP

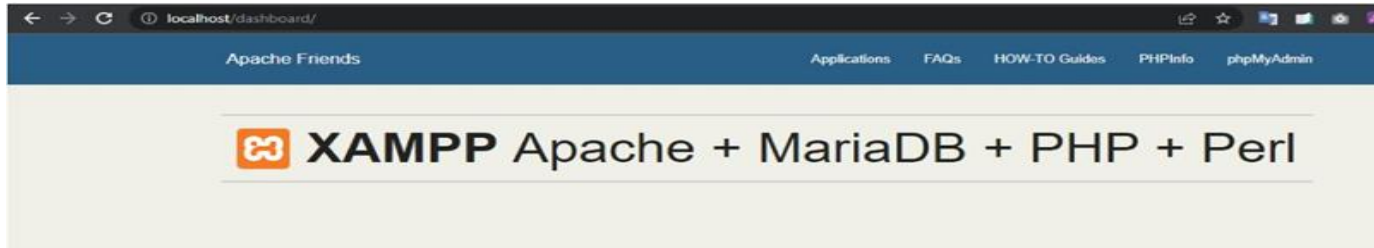

Step 4: After pasting the Drupal project to the XAMPP in the htdocs folder, Now it's time to open the XAMPP and start Apache and MySQL.

Content Management Systems

Installation of Drupal on localhost using XAMPP

Step 5: Now open your favorite web browser, here we used the Chrome web browser and type the localhost. If the below UI opens in your browser then it means that XAMPP installation and everything is fine and now we can proceed with the further process.

Welcome to XAMPP for Windows 8.1.6

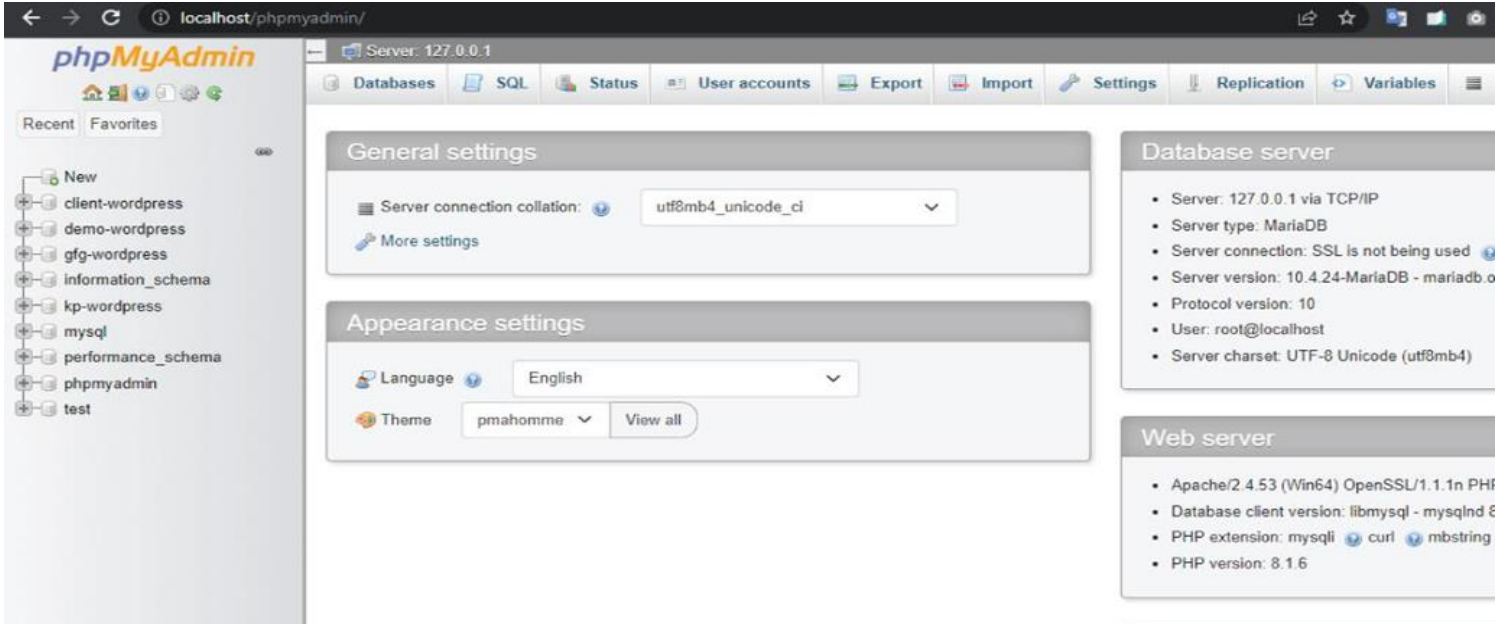

You have successfully installed XAMPP on this system! Now you can start using Apache, MariaDB, PHP and other components. You can find more info in the FAQs section or check the HOW-TO Guides for getting started with PHP applications.

XAMPP is meant only for development purposes. It has certain configuration settings that make it easy to develop locally but that are insecure if you want to have your installation accessible to others. If you want have your XAMPP accessible from the internet, make sure you understand the implications and you checked the FAQs to learn how to protect your site. Alternatively you can use WAMP, MAMP or LAMP which are similar packages which are more suitable for production.

Content Management Systems

Installation of Drupal on localhost using XAMPP

Step 6: Create the database for the Drupal project in the phpMyAdmin, for creating the database now type the localhost/PHPMyAdmin in the browser and hit enter.

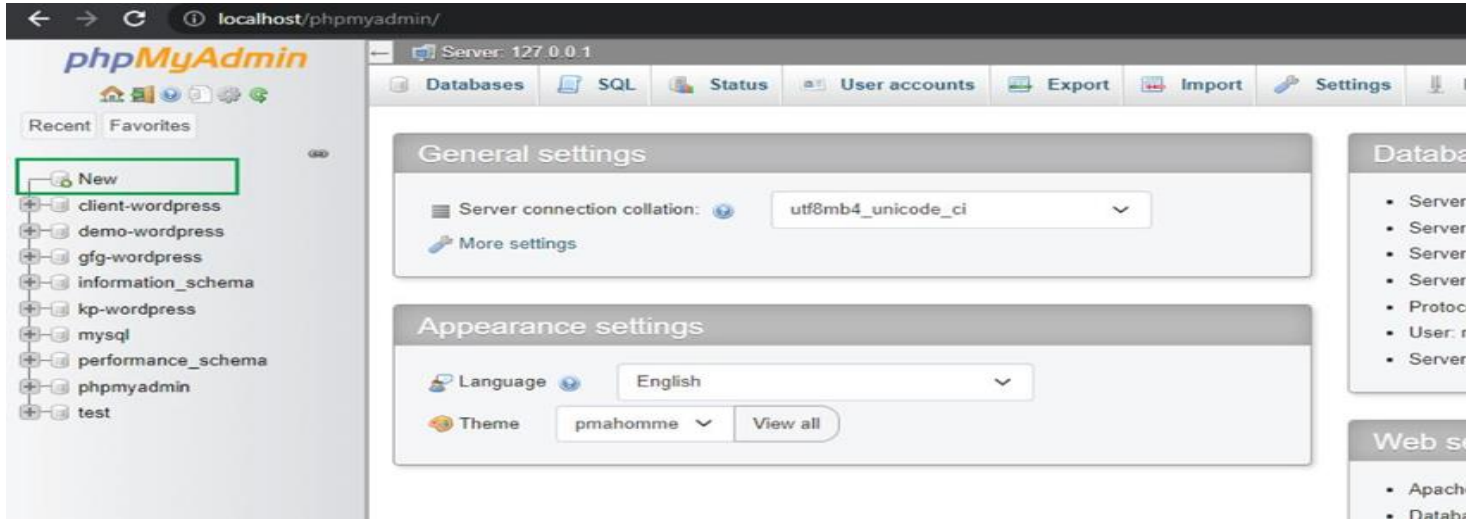

The screenshot displays the phpMyAdmin web interface in a browser window. The address bar shows 'localhost/phpmyadmin/'. The interface includes a top navigation bar with tabs for Databases, SQL, Status, User accounts, Export, Import, Settings, Replication, and Variables. A left sidebar lists recent and favorite databases, including 'New', 'client-wordpress', 'demo-wordpress', 'gfg-wordpress', 'information_schema', 'kp-wordpress', 'mysql', 'performance_schema', 'phpmyadmin', and 'test'. The main content area is divided into three panels: 'General settings' (showing 'Server connection collation' as 'utf8mb4_unicode_ci'), 'Appearance settings' (showing 'Language' as 'English' and 'Theme' as 'pmahomme'), and 'Database server' (listing server details: 'Server: 127.0.0.1 via TCP/IP', 'Server type: MariaDB', 'Server connection: SSL is not being used', 'Server version: 10.4.24-MariaDB - mariadb.o', 'Protocol version: 10', 'User: root@localhost', and 'Server charset: UTF-8 Unicode (utf8mb4)'). A 'Web server' panel at the bottom right lists: 'Apache/2.4.53 (Win64) OpenSSL/1.1.1n PHP', 'Database client version: libmysql - mysqlnd 8', 'PHP extension: mysqli curl mbstring', and 'PHP version: 8.1.6'.

Content Management Systems

Installation of Drupal on localhost using XAMPP

phpMyAdmin dashboard will appear on your screen.

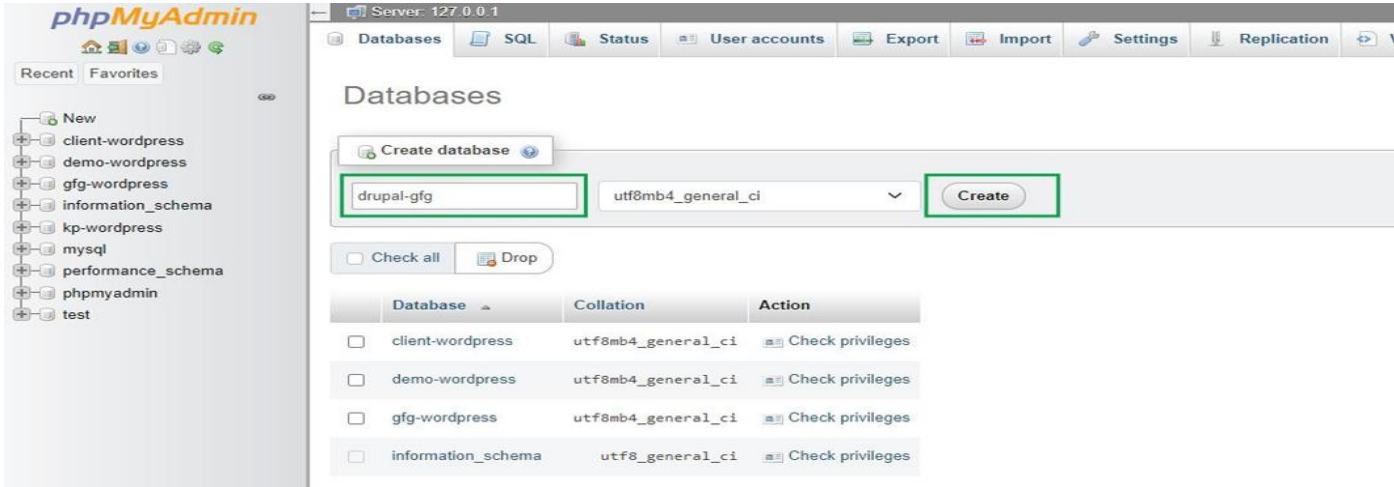

Step 7: Create the database in the phpMyAdmin, Click on the new link to create the new database for your Drupal project.

Content Management Systems

Installation of Drupal on localhost using XAMPP

Step 8: Type the database name, for the demo purpose here I type the “drupal-gfg” as the database name. Later in the installation of drupal, we used this name. And finally, click on the create button to create the database name.

The screenshot shows the phpMyAdmin interface for a MySQL server. The 'Databases' tab is selected. In the 'Create database' section, the text input field contains 'drupal-gfg' and the 'Create' button is highlighted with a green box. Below this, there is a table listing existing databases:

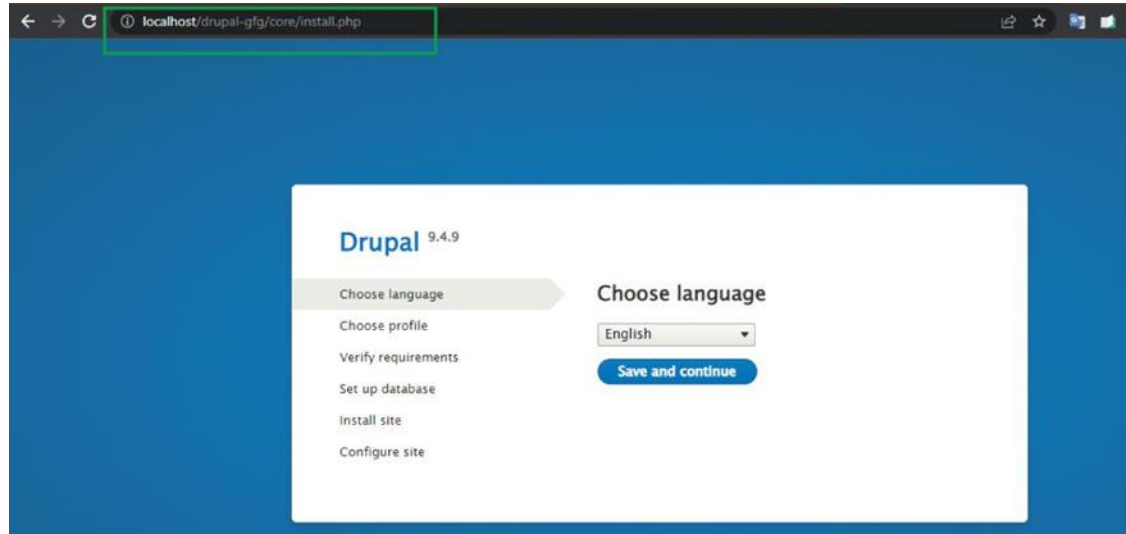

Database	Collation	Action
☐ client-wordpress	utf8mb4_general_ci	Check privileges
☐ demo-wordpress	utf8mb4_general_ci	Check privileges
☐ gfg-wordpress	utf8mb4_general_ci	Check privileges
☐ information_schema	utf8_general_ci	Check privileges

Content Management Systems

Installation of Drupal on localhost using XAMPP

Step 9: After creating the database in the phpMyAdmin, now come to the browser and type the URL as the localhost and the folder name of the drupal project here in my case it is “drupal-gfg”.

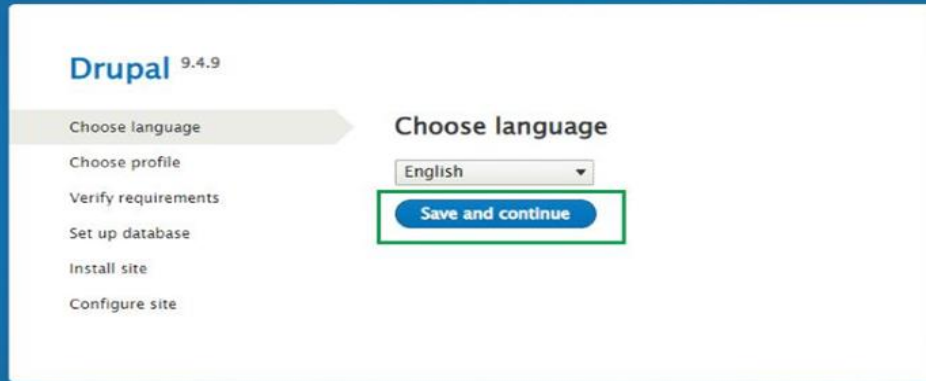

<http://localhost/drupal-gfg>

Content Management Systems

Installation of Drupal on localhost using XAMPP

Step 10: Follow the instructions for the complete installation process of Drupal in your local host. Choose the language and then click on the “Save and continue” button.

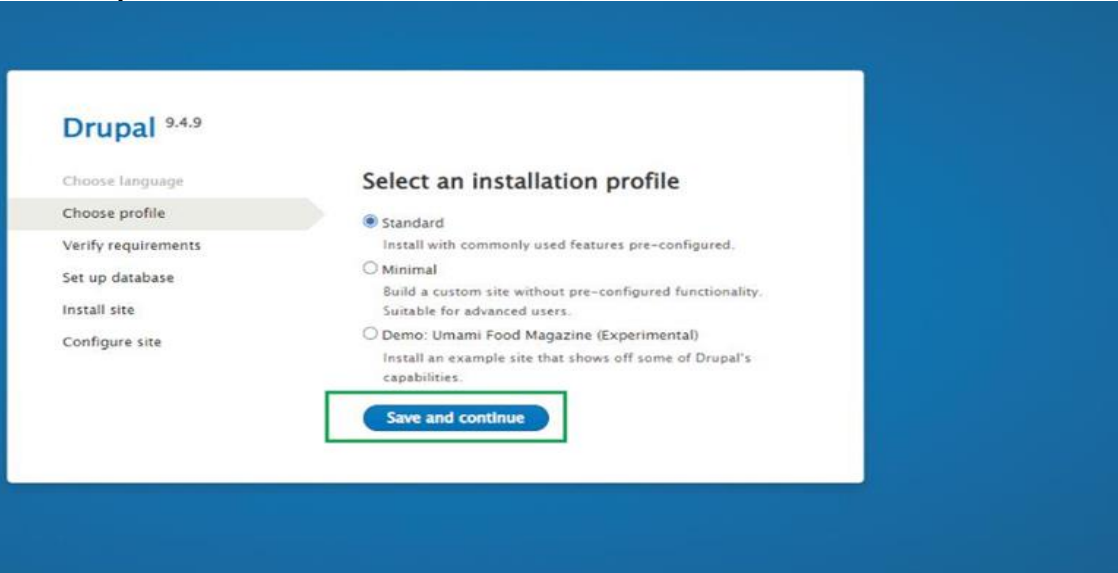

The screenshot shows the Drupal 9.4.9 installation interface. On the left, a vertical list of steps is shown: 'Choose language' (highlighted with a grey arrow), 'Choose profile', 'Verify requirements', 'Set up database', 'Install site', and 'Configure site'. On the right, under the heading 'Choose language', there is a dropdown menu currently set to 'English'. Below the dropdown is a blue button labeled 'Save and continue', which is highlighted with a green rectangular border.

Content Management Systems

Installation of Drupal on localhost using XAMPP

Step 11: In the next step, you have to select the installation profile, It's recommended to choose the "Standard" profile for the installation process. After choosing the profile click on the "Save and continue" button for further process.

The screenshot shows the Drupal 9.4.9 installation interface. On the left, a vertical list of steps is shown: 'Choose language', 'Choose profile' (highlighted with a grey arrow), 'Verify requirements', 'Set up database', 'Install site', and 'Configure site'. The main area is titled 'Select an installation profile' and contains three radio button options: 'Standard' (selected), 'Minimal', and 'Demo: Umami Food Magazine (Experimental)'. Each option has a brief description. At the bottom, a blue 'Save and continue' button is highlighted with a green rectangular border.

Drupal 9.4.9

Warnings found

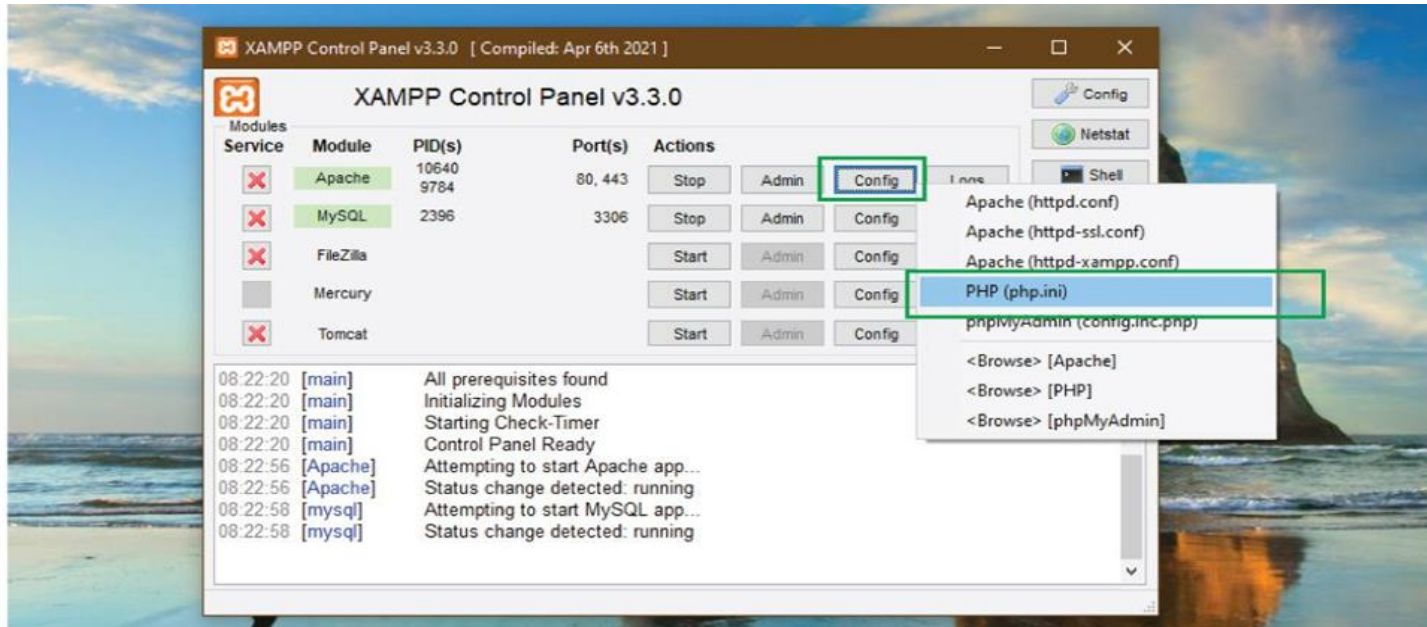

PHP OPCODE CACHING
Not enabled
PHP OPcode caching can improve your site's performance considerably. It is **highly recommended** to have OPcache installed on your server.

OK

Content Management Systems

Installation of Drupal on localhost using XAMPP

Step 13: Now open the XAMPP control panel and click on the “config” button under the Apache section. And then click on the PHP (php.ini).

Content Management Systems

Installation of Drupal on localhost using XAMPP

Step 14: Add this code in php.ini to enable OP code caching.

```
[opcache]
```

```
zend_extension=php_opcache.dll
```

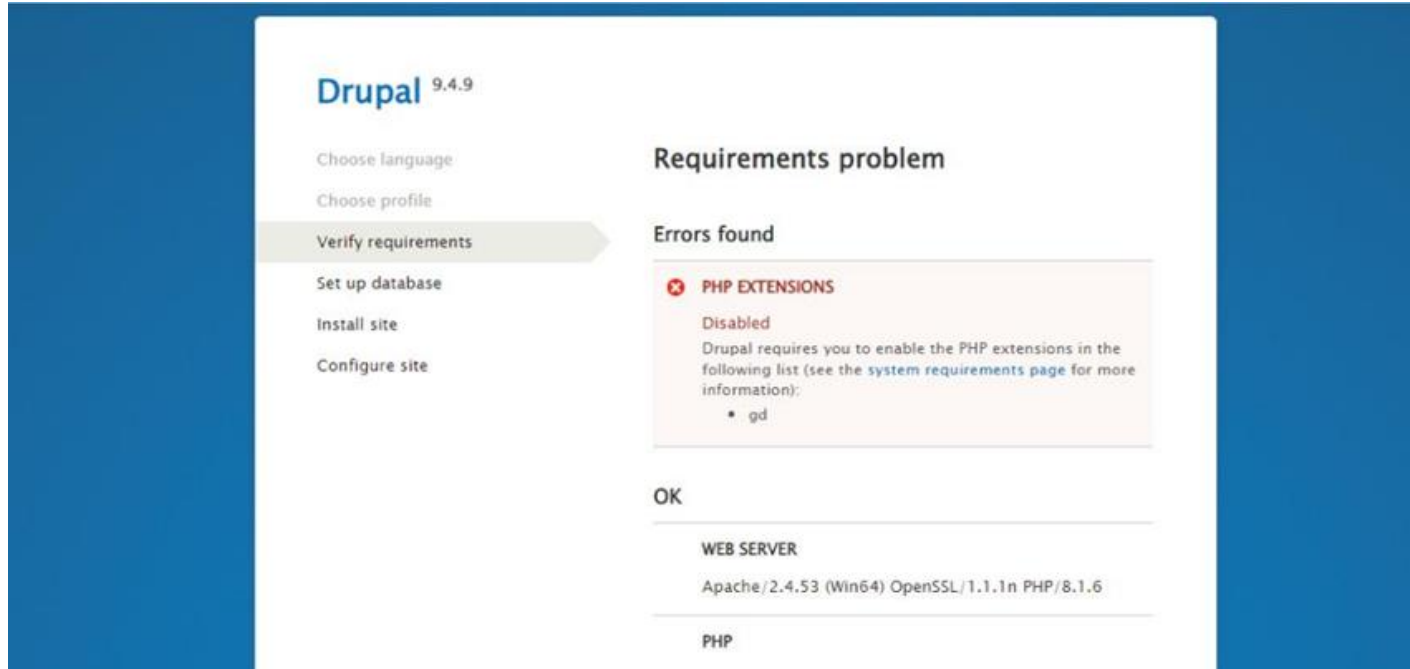

```
; Determines if Zend OPCache is enabled
```

```
opcache.enable=1
```

After adding this code in the php.ini file restart the apache server and refresh your page. you will find the OP code caching error gets solved.

Content Management Systems

Drupal – Creating a Drupal Website

P Sreenivas

Department of Computer Applications

Content Management Systems

Drupal – Setting up Drupal with Basic Elements

The first step is to have website hosting that will be supportive to Drupal.

There are some requirements you'll need to follow such as making sure you have the right PHP version.

Content Management Systems

Drupal – Setting up Drupal with Basic Elements

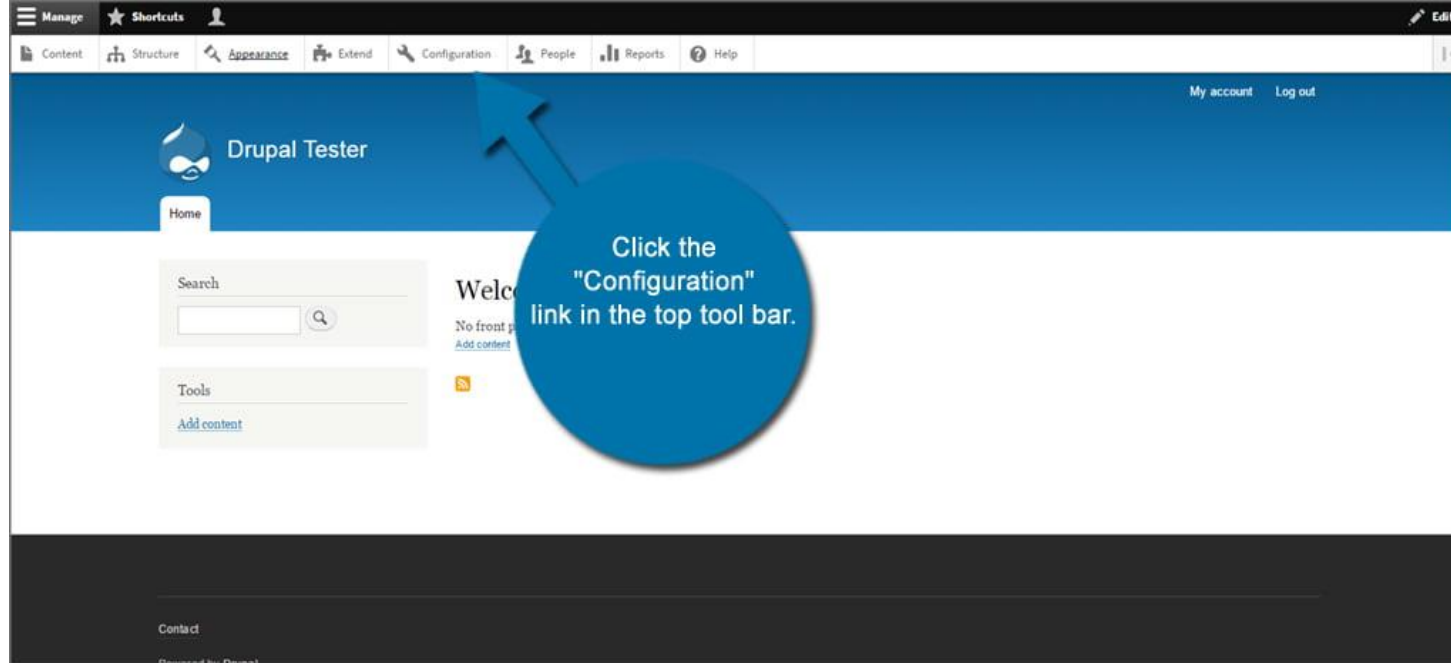

In previous versions of Drupal, the WYSIWYG editor had to be installed separately from the system. However, from Drupal 8 version onwards it comes with most popular text editor module as well as the image uploader.

To edit the settings of Drupal's text editor, click the "Configuration" link in the top tool bar.

Content Management Systems

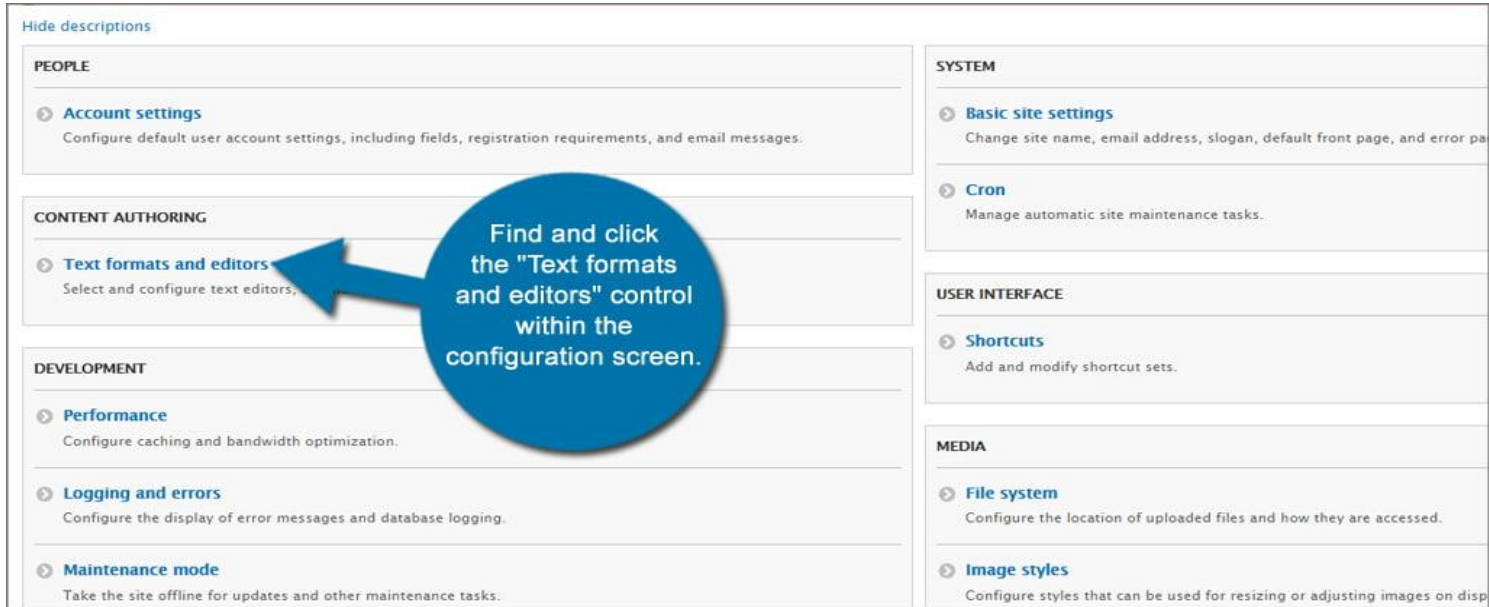

Drupal – Setting up Drupal with Basic Elements

Content Management Systems

Drupal – Setting up Drupal with Basic Elements

Find and click the “Text formats and editors” control in the configuration screen.

The screenshot displays the Drupal configuration interface, organized into a grid of sections. A blue circular callout with a white arrow points to the 'Text formats and editors' link in the 'CONTENT AUTHORIZING' section. The sections visible are:

- PEOPLE**
 - [Account settings](#)
Configure default user account settings, including fields, registration requirements, and email messages.
- CONTENT AUTHORIZING**
 - [Text formats and editors](#)
Select and configure text editors.
- DEVELOPMENT**
 - [Performance](#)
Configure caching and bandwidth optimization.
 - [Logging and errors](#)
Configure the display of error messages and database logging.
 - [Maintenance mode](#)
Take the site offline for updates and other maintenance tasks.
- SYSTEM**
 - [Basic site settings](#)
Change site name, email address, slogan, default front page, and error page.
 - [Cron](#)
Manage automatic site maintenance tasks.
- USER INTERFACE**
 - [Shortcuts](#)
Add and modify shortcut sets.
- MEDIA**
 - [File system](#)
Configure the location of uploaded files and how they are accessed.
 - [Image styles](#)
Configure styles that can be used for resizing or adjusting images on display.

Content Management Systems

Drupal – Setting up Drupal with Basic Elements

In this next screen, you can control how others edit the content on the website while setting roles for the preferred text editor.

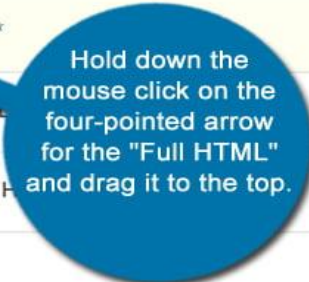

By default, Drupal gives you basic HTML control and tools when writing text. This can be changed from the Text Formats and Editors screen. It uses a drag-and-drop interface for arranging which editor is used primarily..

Content Management Systems

Drupal – Setting up Drupal with Basic Elements

For now, you just want to configure the administrator control. Hold down the mouse click on the four-pointed arrow for the “Full HTML” and drag it to the top. Click the “Save” button on the bottom left.

NAME	TEXT EDITOR	ROLES
 Full HTML*	CKEditor	Administrator
 Basic HTML	CKEditor	Authenticated user,Administrator
 Restricted HTML	—	Anonymous user,Administrator
 Plain text	—	<i>This format is shown when no other formats are available</i>

Content Management Systems

Drupal – Setting up Drupal with Basic Elements

Next, click the “Configure” button of the Full HTML editor. This will open a window to fine-tune your settings even further.

HTML tags and other text is displayed, replaced, or removed. **Improper text format configuration is a security risk.** Learn more on the [Filter module help page](#).

defined on this page. The first format available to a user will be selected by default.

[Show row weights](#)

ROLES	OPERATIONS
Administrator	Configure
Authenticated user,Administrator	Configure
Anonymous user,Administrator	Configure
<i>This format is shown when no other formats are available</i>	Configure

Click the "Configure" button of the Full HTML editor.

From this screen, you can modify the settings and how the editor appears when writing text. You can:

Set user roles: This is based on the permissions you want to give others who write on your site.

Determine which text editor to use: If you install a different text editing module, you can change it from the drop down.

Drag-and-Drop Toolbar Configuration: Drag editing tools you want to use and remove those you don't need.

Content Management Systems

Drupal – Setting up Drupal with Basic Elements

Change the image upload settings: Directory, file sizes and maximum dimensions can all be changed here.

Enable filters: Use check boxes to assign how the editor behaves such as converting URLs to links automatically or align images.

Change the filter processing order: Using drag-and-drop, you can alter the way Drupal conducts your orders.

Content Management Systems

Drupal – Setting up Drupal with Basic Elements

Full HTML ☆

[Home](#) » [Administration](#) » [Configuration](#) » [Content authoring](#) » [Text formats and editors](#)

A text format contains filters that change the display of user input; for example, stripping out malicious HTML or making URLs clickable. Filters are executed from top to bottom and the order is important, since one filter may prevent another filter from doing its job. For example, when URLs are converted into links before disallowed HTML tags are removed, all links may be removed. When this happens, the order of filters may need to be rearranged.

Content Management Systems

Drupal – Setting up Drupal with Basic Elements

Now your website is ready for content using a customized text editor.

There are plenty of editing systems you can find on the Internet if you don't like the default CKEditor within Drupal 8. However, this is one of the better platforms and is stable.

Content Management Systems

Drupal – Choosing a Layout and Theme

The next step is deciding a layout and theme for the website.

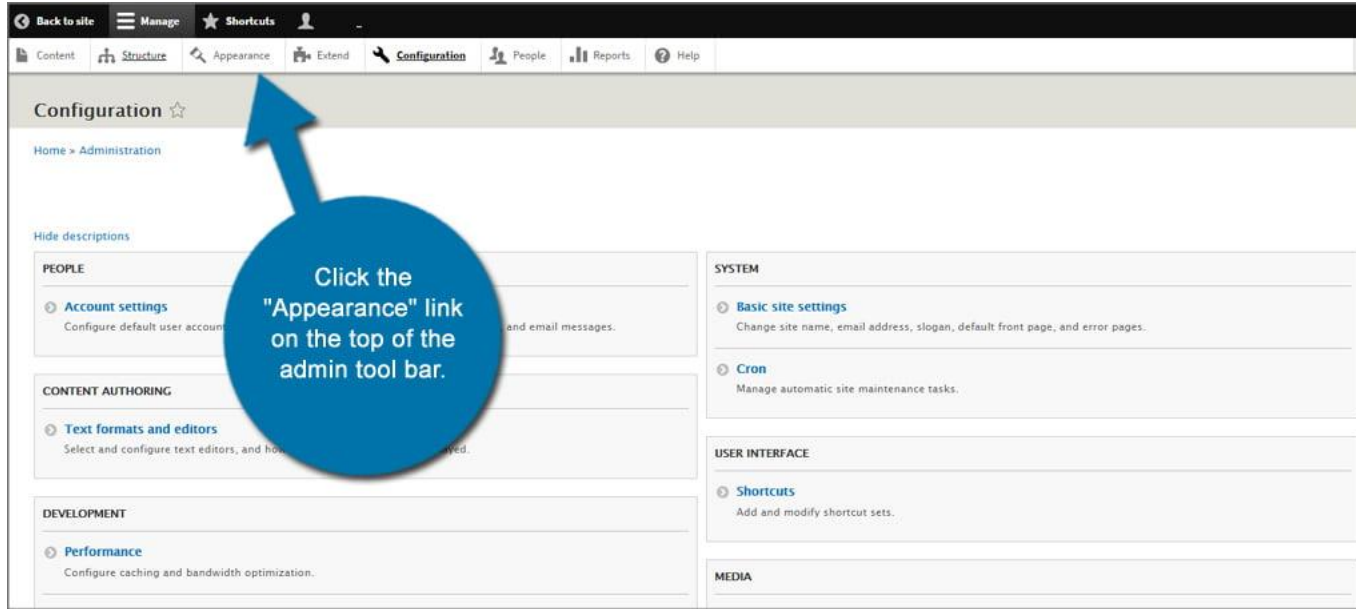

This is where some of the more fun aspects begin.

The appearance of your site is going to play a pivotal role in how visitors react. It can lead to improving business relations as well as increasing the amount of time a person stays on your site reading content.

Click the “Appearance” link on the top of the admin tool bar.

Content Management Systems

Drupal – Choosing a Layout and Theme

Content Management Systems

Drupal – Choosing a Layout and Theme

From this screen, you can edit each theme by clicking the settings button of any you have installed.

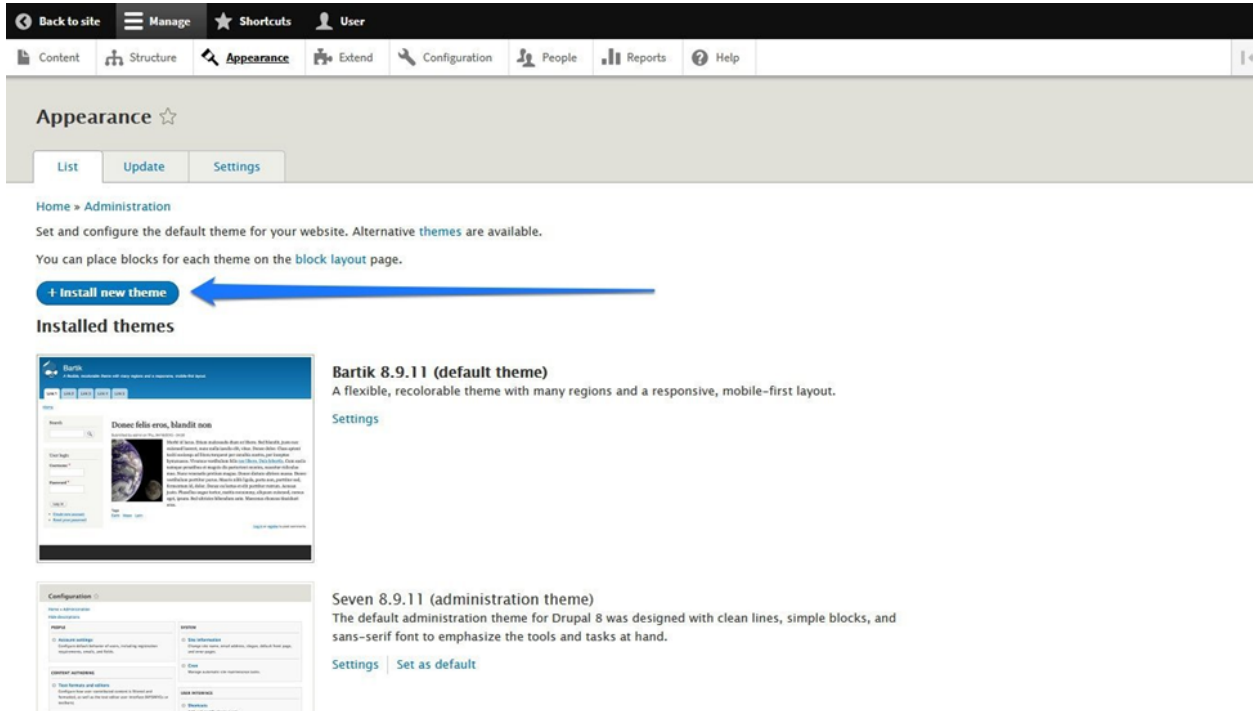

The available adjustments may be different with each theme as developers deliver different components.

However, most will allow great customization in colors as well as modifications to page elements.

Content Management Systems

Drupal – Choosing a Layout and Theme

For now, click the “Install new theme” button above your list of themes.

Appearance ☆

List Update Settings

Home » Administration

Set and configure the default theme for your website. Alternative [themes](#) are available.

You can place blocks for each theme on the [block layout](#) page.

[+ Install new theme](#)

Content Management Systems

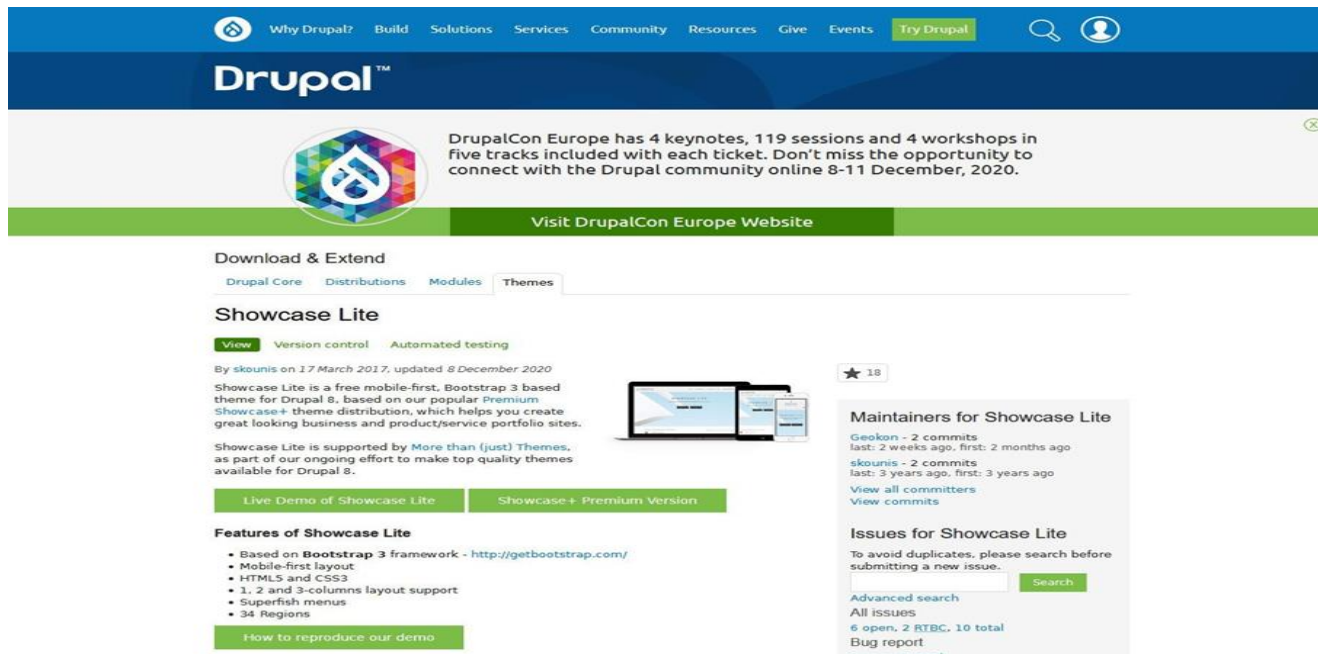

Drupal – Find a theme in directory

However, unlike other content management systems, it is not possible to find themes from inside the Drupal back end. For that, you need to go to the [official Drupal theme directory](https://www.drupal.org/themes) (www.drupal.org), for which you also find a link at the top of the theme installation page.

You may have more than 3,600 themes, the directory gives you several ways of filtering them so you can find what you are looking for.

Showcase Lite

View Version control Automated testing

By skounis on 17 March 2017, updated 8 December 2020

Showcase Lite is a free mobile-first, Bootstrap 3 based theme for Drupal 8, based on our popular Premium Showcase+ theme distribution, which helps you create great looking business and product/service portfolio sites.

Showcase Lite is supported by More than (just) Themes, as part of our ongoing effort to make top quality themes available for Drupal 8.

Live Demo of Showcase Lite Showcase+ Premium Version

Features of Showcase Lite

- Based on **Bootstrap 3** framework - <http://getbootstrap.com/>
- Mobile-first layout
- HTML5 and CSS3
- 1, 2 and 3-columns layout support
- Superfish menus
- 34 Regions

How to reproduce our demo

▼ ADMINISTRATION THEME

Content Management Systems

Drupal – Choosing a Layout and Theme

You can find themes in many areas of the Internet, but it is suggested to check Drupal's website first. These have the greatest chance of being stable with a reduced risk of security issues.

NOTE: Some older themes will not be able to port over to Drupal 8 because of specific files needed for the newest version.

However, unlike other CMSs, it is not possible to find themes from Drupal backend.

You need to go the official Drupal theme directory for which you also find a link on the top of theme installation page.

Drupal.org provides more than 3,000 themes, The directory gives several ways of filtering them so you can find what you are looking for.

Content Management Systems

Drupal – Adding Informative pages

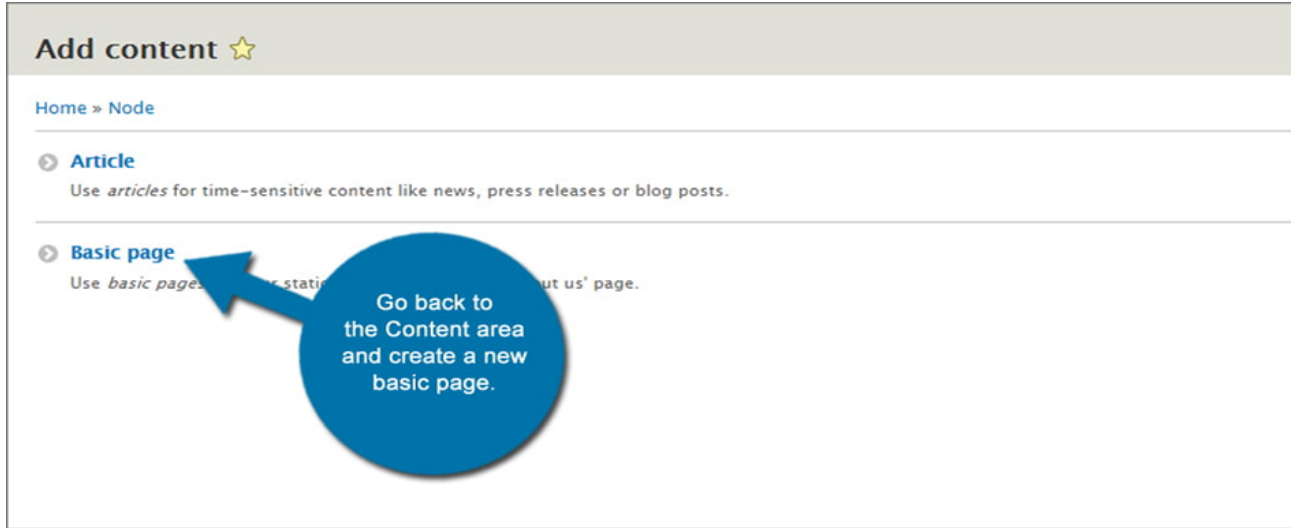

After designing home page, the next step is to build a site with Drupal is setting up your static pages.

Pages like “About Us” “Contact Us” etc need to be build up or creating pages which describes the services you provide delivers information to curious visitors and adds to the engagement.

Content Management Systems

Drupal – Adding Informative pages

To start, go back to the Content area and create a new basic page as described in previous sections.

The screenshot shows the 'Add content' page in Drupal. At the top, there is a header 'Add content' with a yellow star icon. Below it, a breadcrumb trail reads 'Home » Node'. There are two main options listed: 'Article' and 'Basic page'. The 'Article' option is described as 'Use *articles* for time-sensitive content like news, press releases or blog posts.' The 'Basic page' option is described as 'Use *basic pages* for static content like our 'about us' page.' A blue circular callout with a white arrow points to the 'Basic page' option. The text inside the callout reads: 'Go back to the Content area and create a new basic page.'

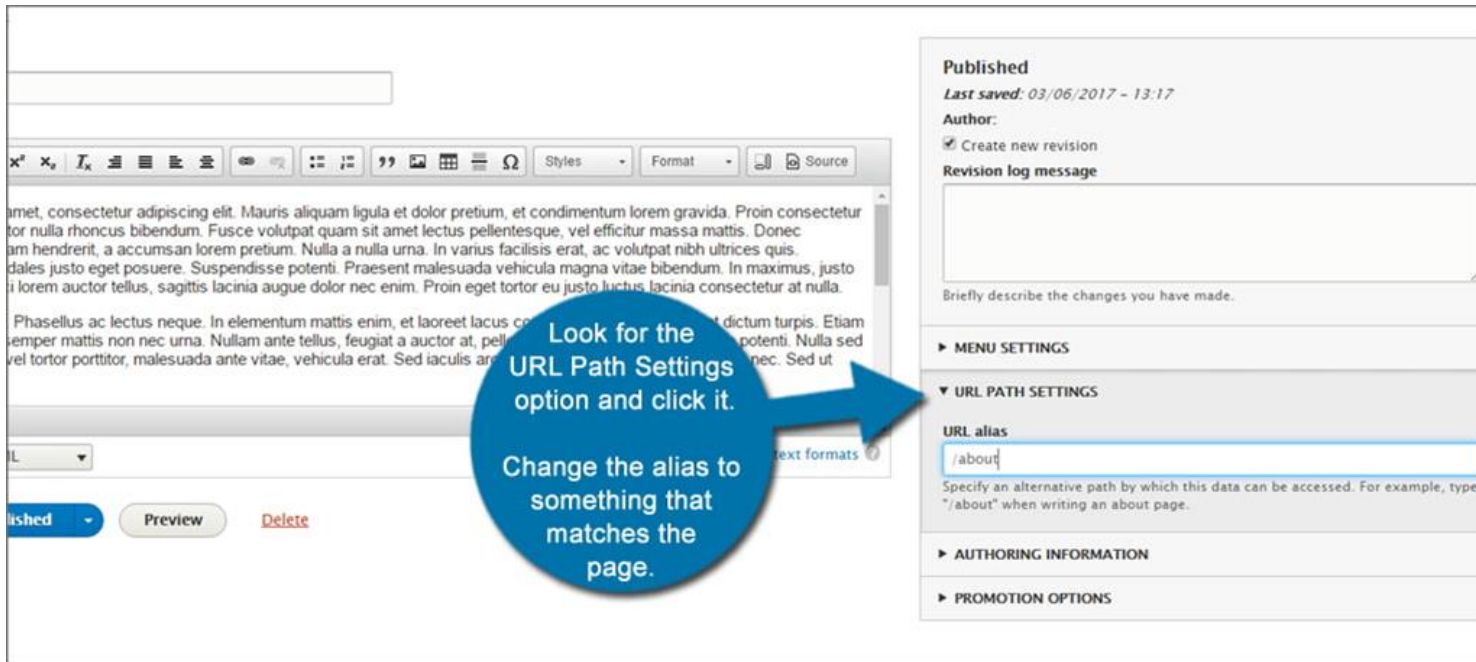

Content Management Systems

Drupal – Adding Informative pages

On the right side of Drupal, look for the URL Path Settings option and click it. This will expand the window to show the URL alias. It can be changed the alias to “**/about**.” You want this alias to be something related to what you’re creating. For instance, you might use “**/service**” for a services page.

Content Management Systems

Drupal – Adding Informative pages

The screenshot shows the Drupal content editor interface. On the left is a text editor with a toolbar and a text area containing placeholder text. On the right is a sidebar with various settings. A blue callout bubble with a white arrow points to the 'URL Path Settings' field in the sidebar. The bubble contains the text: 'Look for the URL Path Settings option and click it.' and 'Change the alias to something that matches the page.' The 'URL Path Settings' field is currently set to '/about'.

Content Management Systems

Drupal – Adding a blog to the site

A blog is one of the most important parts to driving traffic and content marketing. It plays such a vital role that most businesses host this when they create a Drupal Website.

Content Management Systems

Drupal – Adding a blog to the site

In previous versions of Drupal, the blog was part of the core. However, developers have since removed this ability to improve overall functionality of the core. Luckily, this module can be found in Drupal and installed on the website

Content Management Systems

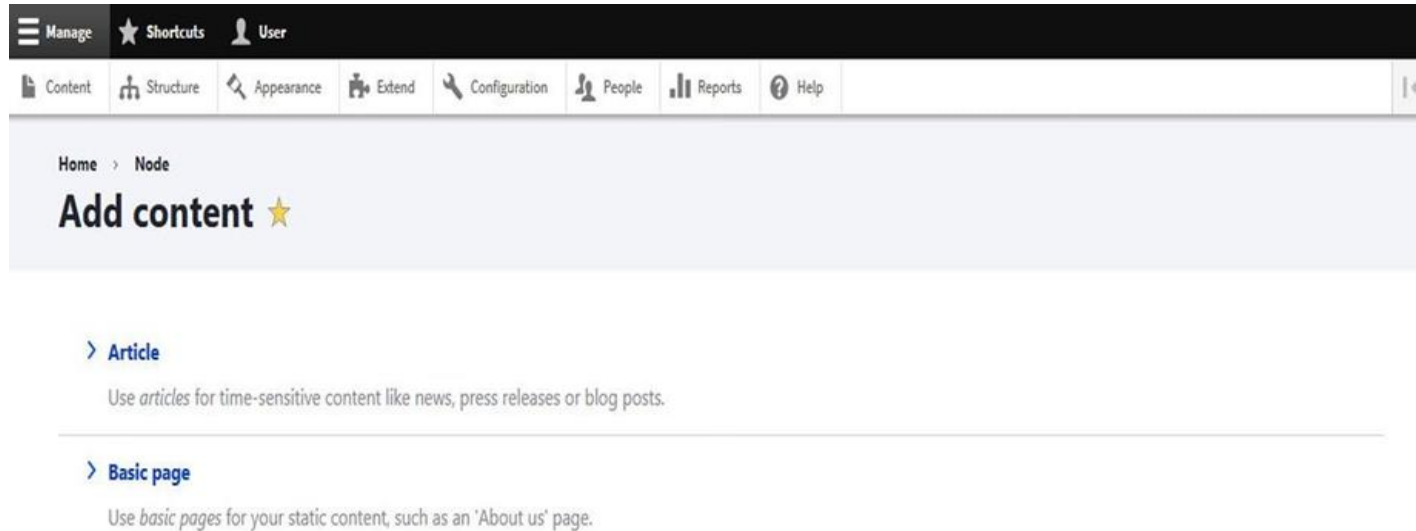

Drupal – Adding a blog to the site

Many people who want to create a website also want to start a blog. In order to start up a blog we have to first create some content.

Creating blog content in Drupal is not that much hard, we have to create blog content through a content type called Article.

Content Management Systems

Drupal – Creating Blog

The screenshot displays the Drupal administration interface. At the top, there is a black navigation bar with 'Manage', 'Shortcuts', and 'User' links. Below this is a horizontal menu with icons and labels for 'Content', 'Structure', 'Appearance', 'Extend', 'Configuration', 'People', 'Reports', and 'Help'. The main content area has a breadcrumb trail 'Home > Node' and a large heading 'Add content' with a yellow star icon. Below the heading, there are two expandable sections: 'Article' and 'Basic page'. The 'Article' section is currently expanded, showing the text: 'Use *articles* for time-sensitive content like news, press releases or blog posts.'

Home > Node

Add content ★

> **Article**

Use *articles* for time-sensitive content like news, press releases or blog posts.

> **Basic page**

Use *basic pages* for your static content, such as an 'About us' page.

Content Management Systems

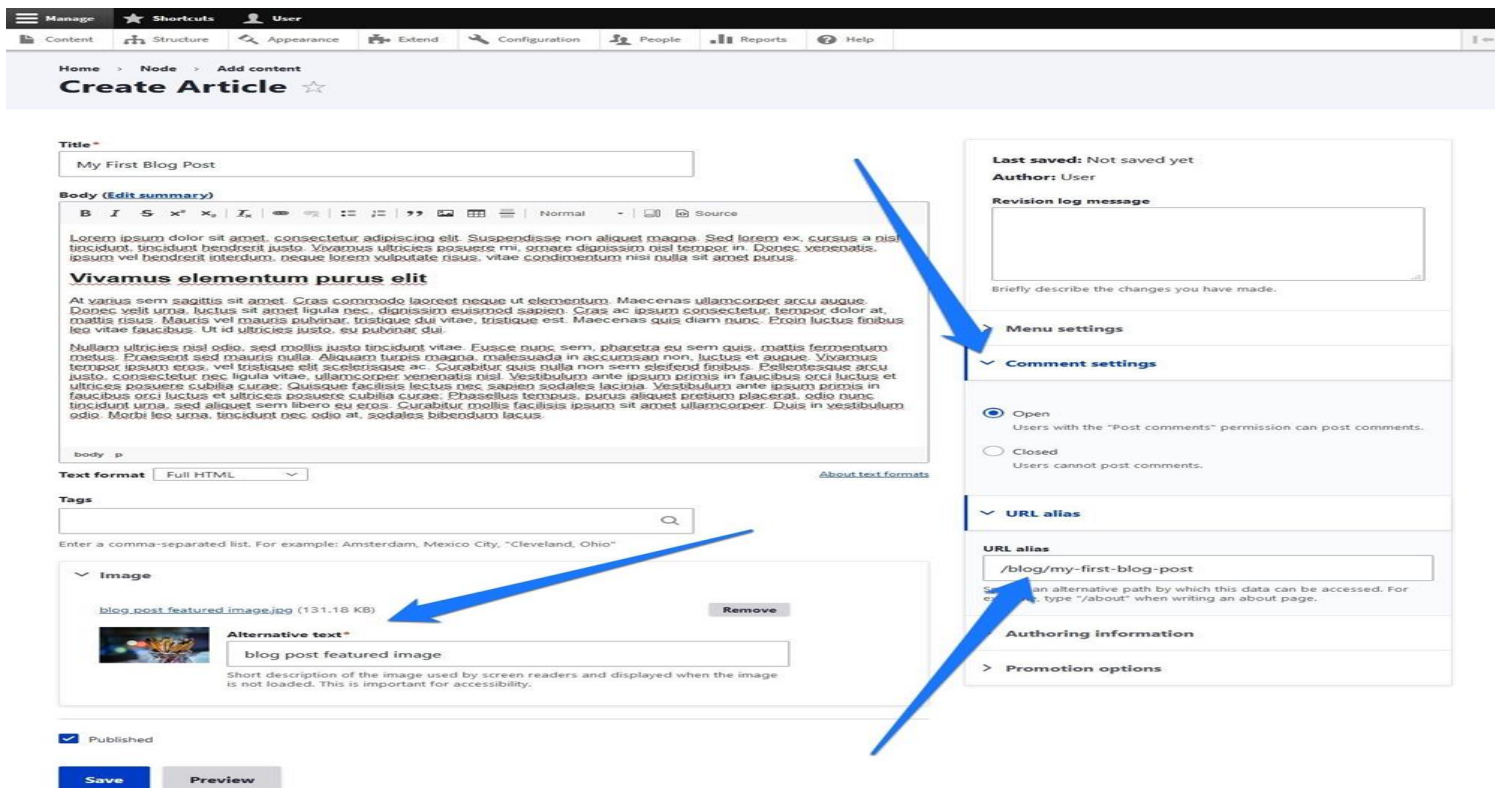

Drupal – Adding a blog to the site

Blog posts works pretty much the same way as pages, simply create a new article, enter title, summary, and content, add the URL and publish it.

In contrast to pages, articles comes with comment settings on the right (by default comments are enabled), and the ability to add tags and featured image at the bottom (browse, upload and add an alternative text)

Content Management Systems

Drupal – Creating a blog site

The screenshot shows the Drupal 'Create Article' form. At the top is a navigation bar with links like 'Manage', 'Shortcuts', and 'User'. Below it is a breadcrumb trail: 'Home > Node > Add content'. The main heading is 'Create Article'. The form is divided into several sections:

- Title:** A text field containing 'My First Blog Post'.
- Body (Edit summary):** A rich text editor with a toolbar and a text area containing placeholder text. A blue arrow points to this section.
- Text format:** A dropdown menu set to 'Full HTML'.
- Tags:** A search field with the instruction 'Enter a comma-separated list. For example: Amsterdam, Mexico City, "Cleveland, Ohio"'. A blue arrow points to this field.
- Image:** A section showing a file named 'blog_post_featured_image.jpg (131.18 KB)' with a 'Remove' button. Below it is an 'Alternative text' field containing 'blog post featured image'. A blue arrow points to this field.
- Right sidebar:** Contains several settings sections:
 - Last saved:** Not saved yet
 - Author:** User
 - Revision log message:** A text area.
 - Menu settings:** A section with a dropdown arrow.
 - Comment settings:** A section with a dropdown arrow and two radio buttons: 'Open' (selected) and 'Closed'.
 - URL alias:** A section with a dropdown arrow and a text field containing '/blog/my-first-blog-post'. A blue arrow points to this field.
 - Authoring information:** A section with a dropdown arrow.
 - Promotion options:** A section with a dropdown arrow.

At the bottom of the form are two buttons: 'Save' and 'Preview'.

Content Management Systems

Drupal – Adding a blog to the site

Besides that, under URL alias you should consider including the blog address into the URL to something like /blog/post-title, you want to organize your content, Otherwise your blog articles will simply appear under <http://yourdomain.com/post-title>

Authoring information can also change the publishing date and time.

The final result will look like:

Content Management Systems

Drupal – Adding a blog to the site

Set up a blog page

Once you have created a blog post, its now to make it show up on the page. For that we have create a so-called View.

You can find this option Structure→Views

Content Management Systems

Drupal – Configure the view

Here click Add view to get this screen.

The screenshot shows the 'Add view' configuration screen in Drupal. The breadcrumb trail is 'Home > Administration > Structure > Views'. The page title is 'Add view' with a star icon. The form is divided into four sections: 'View basic information', 'View settings', 'Page settings', and 'Block settings'. The 'View basic information' section has a 'View name*' text field and an unchecked 'Description' checkbox. The 'View settings' section has 'Show:' set to 'Content', 'of type:' set to 'All', a 'tagged with:' search field with a 'Loading...' label, and 'sorted by:' set to 'Newest first'. The 'Page settings' section has an unchecked 'Create a page' checkbox. The 'Block settings' section has an unchecked 'Create a block' checkbox. At the bottom are 'Save and edit' and 'Cancel' buttons.

Back to site Manage Shortcuts User

Content Structure Appearance Extend Configuration People Reports Help

Home > Administration > Structure > Views

Add view ☆

View basic information

View name*

☐ Description

View settings

Show: of type: tagged with: Loading... sorted by:

Page settings

☐ Create a page

Block settings

☐ Create a block

Save and edit Cancel

Here's how to fill in the View basic information:

- View name — This is the name that will show up in the Views menu to help you identify it.
- Description — This, again, shows up in the Views menu as an explanation for what the view does. Filling it in is optional.

Under View settings, you want to pick to show Content of the type Article sorted by Newest first. This way, your latest blog post will always be at the top.

After that, its time to move to Page settings:

Create a page — Enable this to have Drupal create an individual page for this view.

Page title — The title of the page. In this case, a Blog is probably appropriate.

Path — The page's URL ending. Again, a blog is an obvious choice. Be sure to make it the same as what you have chosen in the post if you entered anything there.

Content Management Systems

Drupal – Configure the view

After that, its time to move to Page settings:

Page display settings — Choose in which format to display posts (grid, HTML list, table, unformatted list) and what part to show (teasers, titles, linked titles, or fields). In this case, we went with an *Unformatted list* and *Teasers*.

Items to display — How many posts you want to show on the page.

Use a pager — Whether to include pagination for this view.

Create a menu link — We've covered this earlier in the part of the tutorial on Drupal menus. Just don't forget to pick your main navigation from and configure a link title (may we suggest *Blog?*).

Content Management Systems

Drupal – Configure the view

Click on Save and Edit, and then you should find your newly created blog on the front end of your page.

Content Management Systems

Quiz

1. The blog content in Drupal can be created through
 - a. Page
 - b. Node
 - c. Article
 - d. Menu

Ans. C

1. Which information of the post/page can change the publishing date and time?
 - a. Node information
 - b. Content information
 - c. Article information
 - d. Menu information

Ans. c

Content Management Systems

Quiz

1. To set up a blog page to show up in the website, what need to be created?
 - a. Menu
 - b. View
 - c. Content
 - d. Structure

Ans. b

Content Management Systems

Drupal – Adding and Managing a Module

P Sreenivas

Department of Computer Applications

What is a Module???

A module is a set of PHP, JavaScript, and/or CSS files that extends site features and adds functionality.

You can turn the features and functionality on by installing the module, and you can turn it off by uninstalling the module; before uninstalling, you may need to remove data and configuration related to the feature or functionality.

Content Management Systems

Drupal – Adding and Managing a Module

Each module that is installed adds to the time needed to generate pages on your site, so it is a good idea to uninstall modules that are not needed.

The core download provides modules for functionality such as:

1. Managing user accounts (the core User module)
2. Managing basic content (the core Node module) and fields (the core Field and Field UI modules; there are also core modules providing field types)
3. Managing navigation menus (the core Menu UI module)
4. Making lists, grids, and blocks from existing content (the core Views and Views UI modules)

You can download additional *contributed modules* from the [Drupal.org Module Downloads](#), or create your own *custom modules*.

Content Management Systems

Drupal – Adding and Managing a Module

Installing a Module

You start by adding a module, then install it (/admin/modules) to make it work, then set Permissions (/admin/people/permissions) to allow people to use it, and Configure it (location varies by module as described on its page). These steps are separated for security.

As time passes, you Update modules (/admin/modules/update) regularly for security and functions. If you don't need a module, you can't just disable it as in Drupal 7, but you need to Uninstall it (/admin/modules/uninstall)

Note: This will also remove the configuration. Finally you can remove the module folder, which is not required, but keeps your site clean.

Content Management Systems

Drupal – Adding and Managing a Module

Step1 : Install a Module

If Drupal core module, go to step 2

If the module you want to install is part of Drupal core you can skip ahead to the next step. To find out if it's in core, go to site's /admin/modules page. Core modules are already included so don't need to be added.

Several ways to add modules

The recommended way of adding a module is with Composer, especially for modules that have dependencies. Several modules will just not work if you only add the zip / tar.gz file.

Content Management Systems

Drupal – Adding and Managing a Module

Though not recommended, if you can't use Composer on your site (such as shared host), you can simulate Composer using Ludwig for those (few) modules that offer Ludwig.

Also not recommended, but you can add by manually downloading the .zip or .tar.gz file. This only works for modules that don't have dependencies.

Content Management Systems

Drupal – Adding and Managing a Module

Add a module using Drupal's User Interface

An alternative way of adding a module is to click on the latest release on the module's page,

for example https://www.drupal.org/project/file_replace/releases/8.x-1.3. Then copy the "tar.gz" link under the "Alternative installation files", and paste that link on your site at /admin/modules/install in the URL box and press Install. Now skip to the next step.

Step 2: Install the module

Using the Drupal User Interface (easy):

Navigate to the Extend page (admin/modules) via the Manage administrative menu

Locate the module(s) you wish to install and check the box next to each one

Click Install to install (turn on) the new module(s)

Or use the command line (advanced, but very efficient).

Content Management Systems

Drupal – Adding and Managing a Module

Step 3: Set user permissions

So many people forget to set permissions (/admin/people/permissions) for the newly added module. Without giving the right permissions, your users will not be able to use the module. For security, permissions are not initially installed, after adding a new module, for anyone except the Administrator.

Content Management Systems

Drupal – Adding and Managing a Module

Step 4: Configure a module

A few modules work without any need for setting permissions or configuring. Most, however, require one or both. You'll find configuration instruction on each module's page, in its documentation, or README.md file.

Content Management Systems

Drupal – Adding and Managing a Module

Keeping modules organized

Drupal will look for modules in a few different locations; The root /modules directory (preferred), or any /sites/*/modules directory. Within these locations, Drupal will recurse through all subdirectories looking for modules.

A common practice is to add all modules downloaded from Drupal.org to /modules/contrib. And all modules containing custom project-specific code to /modules/custom.

What is a module?

- a. set of PHP, JavaScript, and/or CSS files that extends site features
- b. Set of html files that extends site features
- c. Set of html, css and javascript files that export site features.
- d. Set of PHP files only that extend site features

Ans. A

How can you turn off features of a module?

- a. By installing the module
- b. By destructing the module
- c. By uninstalling the module.
- d. By removing the module name from the database

Ans. c

Content Management Systems

Quiz

In which location all drupal modules are located?

- a. /node/modules
- b. /pages/modules
- c. /posts/modules.
- d. /root/modules

Ans. d

Content Management Systems

Drupal – Theming in Drupal

What is Drupal Theming?

Theming in Drupal is all about giving your website or web application a personal touch. It's the process of designing and customizing how everything looks and is laid out.

Whether you're fine-tuning a pre-built theme or opting for a unique design, theming involves playing around with HTML, CSS, JavaScript, and Drupal's theming system. It often calls for a team effort, with designers and developers working together to create the perfect visuals and functionality for your site.

Content Management Systems

Drupal – Theming in Drupal

All Things New - Drupal 10

“How to make Drupal better and easier for the community” has always been one of the goals of Drupal. And with the release of Drupal 10, we can experience an even more user-friendly platform for both experienced and beginner developers. A few of the key features highlighted in this release are Claro and Olivero themes, Symfony 6, Theme Starterkit, JavaScript components, and CKEditor 5.

Claro Administration Theme

The Claro administration theme is a new addition to Drupal 10, replacing the previous Seven theme. It offers a modern and user-friendly interface for administering Drupal websites. Claro focuses on accessibility, making it easier for users with disabilities to navigate and use the administration interface. The theme aligns with the Olivero default theme which provides a consistent look and feel across the website. Additionally, the Claro theme ensures fast-loading performance, even on slower internet connections.

Content Management Systems

Drupal – Theming in Drupal

Olivero Default Theme

Olivero is the default theme in Drupal 10. It brings in a modern, responsive, and accessible interface. Olivero focuses on providing a clean and lightweight foundation for customization while meeting high standards of accessibility. It's fully responsive and provides an optimal viewing experience across different devices. Further, it boasts a sleek and visually appealing design, incorporating custom typography, color schemes, and other design elements.

Content Management Systems

Drupal – Theming in Drupal

Theme Starterkit Tools

Drupal 10 introduces the Theme Starterkit, a valuable tool for developers and designers to create custom themes. It offers customizable templates, allowing users to start their themes based on these templates. The Theme Starterkit also supports Sass, simplifying the process of writing and managing CSS styles.

Additionally, accessibility is prioritized in the design of the Theme Starterkit, providing templates and tools that assist in creating accessible and user-friendly themes.

Benefits of Theming with Drupal

- 1. Enhanced Theming Architecture**
- 2. Responsive Web Design**
- 3. Extensive theming options**
- 4. Seamless Integration with Third party tools**
- 5. Community support and resources**

Content Management Systems

Drupal – Theming in Drupal

How to define theme with an .info.yml file

To create a theme for Drupal 8 or later, you need to first create a THEMENAME.info.yml file that provides meta-data about your theme to Drupal.

This is similar to how modules and installation profiles are being defined, and as such, it is important to set the 'type' key in the file.info.yml to 'theme' in order to differentiate it.

Content Management Systems

Drupal – Theming in Drupal

Name your theme

The first step in creating a theme is to choose a human-readable name for it, and a corresponding machine name. The machine name will be used as the name for files, folders, and functions in your theme, and is used by core Drupal programmatically to refer to your theme.

The machine name is usually the human-readable name, converted to lower-case and with underscores instead of spaces. For example, if your theme is named "Fluffiness", then the machine name is "fluffiness". If your theme name is longer, like "Very Fluffy", your machine name would be "very_fluffy".

Content Management Systems

Drupal – Theming in Drupal

Create an `.info.yml` file

Create the `.info.yml` file in the root of your themes folder. The folder name is the machine name, and the info file name is `machine_name.info.yml`.

For the rest of this page, we'll create a theme whose human-readable name is "Fluffiness" and machine name is "fluffiness", so the folder is named "fluffiness/" and the `.info.yml` file is named "fluffiness/fluffiness.info.yml".

If the file is present with the minimum required properties (name, type, base theme and `core/core_version_requirement`) your theme will be visible on your website at Manage > Appearance (<http://example.com/admin/appearance>).

Content Management Systems

Drupal – Theming in Drupal

Example

```
name: Fluffiness
type: theme
description: 'A cuddly theme that offers extra fluffiness.'
core_version_requirement: '>=9.2'
libraries:
  - fluffiness/global-styling
base theme: stable9
regions:
  header: 'Header'
  content: 'Content'
  sidebar_first: 'Sidebar first'
  footer: 'Footer'
```

Content Management Systems

Drupal – Configuring your WYSIWYG editor

P Sreenivas

Department of Computer Applications

Content Management Systems

Drupal – Configuring WYSIWYG editor

WYSIWYG editors allows the use of client-side editors to edit content.

It simplifies the installation and integration of the editor of your choice.

This module replaces all other editor integration modules. No other Drupal module is required.

Content Management Systems

Drupal – Configuring WYSIWYG editor

The Wysiwyg module supports any kind of client-side editor including HTML editors (a.k.a. WYSIWYG), "pseudo-editors" (buttons to insert markup into a textarea), or even Flash-based applications.

The editor library must be downloaded separately. Various editors are supported.

Content Management Systems

Drupal – Configuring WYSIWYG editor

The Wysiwyg module also provides an abstraction layer for other Drupal modules to integrate with any editor.

This means that other Drupal modules can expose content-editing functionality, regardless of which editor you have installed.

Installation

- ☐ Download and install the module as usual.
- ☐ Go to Administer » Site configuration » Wysiwyg, and follow the on-screen installation instructions that are displayed there.
- ☐ Follow the on-screen installation instructions. Do not download/extract editor libraries upfront.
- ☐ Do not alter any files of this module manually.

The Wysiwyg module currently supports the following editors: CKEditor, EpicEditor, FCKeditor, jWYSIWYG, NicEdit, TinyMCE, Whizzywig, WYMeditor.

Note: Only CKEditor 4 and TinyMCE 4 editor are supported after May 2022 in Drupal.

Content Management Systems

Drupal – Configuring WYSIWYG editor

Drupal is integrated with CKEditor 5 as the default What You See Is What You Get (WYSIWYG) editor. The Editor module provides an API to integrate WYSIWYG editors, although CKEditor (the default editor) contributed modules can provide integrations with other WYSIWYG editors.

Content Management Systems

Drupal – Configuring WYSIWYG editor

Text formats control the formatting of content and the WYSIWYG editor configuration for content authors. The standard Drupal installation profile provides a fully configured text format with the enabled CKEditor

Getting ready

Before getting started, make sure the CKEditor module is installed. This module is automatically installed with Drupal's standard installation.

Content Management Systems

Drupal – Configuring WYSIWYG editor

How to do it...

Before getting started, make sure the CKEditor module is installed. This module is automatically installed with Drupal's standard installation.

Let's create a new text format with a custom CKEditor WYSIWYG configuration:

1. Visit Configuration from the administrative toolbar and head to Text formats and editors under the Content Authoring heading.
2. Click on Add text format to begin creating the next text format.
3. Enter a name for the text format, such as the Editor format.

4. Select which roles have access to this format – this allows you to have granular control over what users can use when authoring content.
5. Select CKEditor from the Text editor select list. The configuration form for CKEditor will then be loaded.
6. You may now use an in-place editor to drag buttons onto the provided toolbar to configure your CKEditor toolbar:

Content Management Systems

Drupal – Configuring WYSIWYG editor

Warning message

CKEditor 5 is not compatible with Internet Explorer 11. Text fields using CKEditor 5 will still be editable but without the benefits of CKEditor.

CKEditor 5 ▾

Toolbar configuration

Move a button into the *Active toolbar* to enable it, or into the list of *Available buttons* to disable it. Buttons may be moved with the mouse or keyboard arrow keys.

The toolbar buttons that don't fit the user's browser window width will be grouped in a dropdown. If multiple toolbar rows are preferred, those can be configured by adding an explicit wrapping breakpoint wherever you want to start a new row.

Figure 2.1 – The text format edit form

7. Select any of the Enabled filters options, as shown in Figure 2.2, except for Display any HTML as plain text. That would be counterintuitive to using a WYSIWYG editor:

Enabled filters

- ☒ Limit allowed HTML tags and correct faulty HTML
- ☐ Display any HTML as plain text
- ☐ Convert line breaks into HTML (i.e. `<br>` and `<p>`)
- ☐ Convert URLs into links
- ☒ Align images
Uses a `data-align` attribute on `<img>` tags to align images.
- ☒ Caption images
Uses a `data-caption` attribute on `<img>` tags to caption images.
- ☒ Restrict images to this site
Disallows usage of `<img>` tag sources that are not hosted on this site by replacing them with a placeholder image.
- ☐ Correct faulty and chopped off HTML
- ☒ Track images uploaded via a Text Editor
Ensures that the latest versions of images uploaded via a Text Editor are displayed.

Figure 2.2 – The Enabled filters checkboxes

8. Once you're satisfied, click on Save configuration to save your configuration and create the text filter. It will now be available to users when adding content to rich text fields.

How it works...

The Filter modules provide text formats that control how rich text fields are presented to the user. Drupal will render rich text saved in a text area based on the defined text format for the field.

Text fields with “formatted” in their title will respect text format settings; others will render in plain text.

The Editor module provides a bridge to WYSIWYG editors and text formats. It alters the text format form and rendering to allow the integration of WYSIWYG editor libraries. This allows each text format to have a configuration for its WYSIWYG editor.

Out of the box, the Editor module alone does not provide an editor. The CKEditor module works with the Editor API to enable the usage of the WYSIWYG editor. Contributed modules can provide support for other WYSIWYG editors.

For instance, the TinyMCE module (<https://www.drupal.org/project/tinymce>) integrates Drupal with the TinyMCE editor (<https://www.tiny.cloud/tinymce>).

Content Management Systems

Quiz

2. What is the name of the module, that can be integrated with CK Editor in Drupal
- a. TinyMCE module
 - b. Mice module
 - c. Tiny CK
 - d. Tiny Notepad++

Ans. a

Drupal – Creating custom type content with custom fields

P Sreenivas

Department of Computer Applications

Content Management Systems

Drupal – Creating custom type content with custom fields

When creating a custom content type the first step is to set the **base configuration** for the content type. After that you may optionally add one or more **fields**.

Content Management Systems

Drupal – Creating custom type content with custom fields

Step by step:

- ☐ Navigate to the Content types page (Administer > Structure > Content types).
- ☐ Click Add Content Type.
- ☐ In the Name field, add a name for the content type. The name is required.
- ☐ In the Description field, you can write a description of the content type that will show up on the Add new content page (Administer > Content > Add new content). The description is not required.

Content Management Systems

Drupal – Creating custom type content with custom fields

- ☐ Set your preferred base configuration for this content type. Any content that you create of this content type will have these values by default.
- ☐ The values can be overridden for each content created. You can specify default values for Submission form settings, Publishing options, Display settings, Comment settings and Menu settings.
- ☐ Once your preferred base configuration is saved, you can either click

Content Management Systems

Drupal – Creating custom type content with custom fields

Save content type or Save and add fields. Save Content Type leaves the content type with the Title and Body fields, while Save and Add Fields allows you to add more fields to the content type. You can always add more fields later.

- ☐ When adding fields, you have the choice to either add a new field or add an existing field. See this [guide](#) for adding fields to content types.
- ☐ Once your content type has the desired fields, you can create an instance of it as a node by navigating to the content page (Administer > Content). Then select the name of your content type.

Drupal – Creating Menus and linking content

P Sreenivas

Department of Computer Applications

Content Management Systems

Drupal – Creating Menus and Linking content

Ensure that Menus module is activated before you begin linking the content

If the link you plan to add leads to a Drupal node, first be sure your menu is enabled in the node's content type.

Content Management Systems

Drupal – Creating Menus and Linking content

Adding a link directly into the Menu

Navigate to the Menus page (*Structure > Menus* or <http://example.com/admin/structure/menu>).

Locate a menu to edit and click **add link**.

In the **Menu link title** field, enter the title as it will be displayed in the menu.

In the **Link** field, enter a path for the link. This can be an internal Drupal path such as `/node/add` or an external URL such as `http://example.com`. Enter `<front>` to link to the front page.

Adding a link directly into the Menu

In the **Description** field, enter the text that will be displayed when a user hovers over the link.

Enable any of the following options:

Enabled: If the link is not enabled, it will not be displayed in the menu.

Show as Expanded: If this option is enabled and the menu link has children, the first level children of the menu link will always be expanded. (NOTE: This rule doesn't cascade down for subsequent levels of children links. You must enable this option at each level where you want the next level to be expanded.)

In the **Parent link** list, select the parent of the link.
(Optional) In the **Weight** list, select the relative weight of the link. Links with the "lightest" weight will display higher in a menu. Links with the same weight will display in alphabetical order.
Click **Save**.

Configuring Menu settings for a content type

This configuration allows you to use the node edit page to configure a menu link

Navigate to the content type for the node (*Structure > Content types* or <http://example.com/admin/structure/types>).

Locate the content type and click **edit**.

Choose **Menu settings**.

Click the checkbox of the menu you need.

(Optional) Set the **Default parent item** to choose a default menu for this content type.

Using the node edit page to add a menu link

Navigate to the node editing screen

(*Node > Edit* or http://example.com/node/*/edit) for the node you want to add to the menu (this is in the Content menu for Drupal 7). This can also be done when you first create the node.

Click the checkbox marked **Provide a menu link** in the Menu Settings tab. The menu options will appear.

In the **Menu link title** field, enter the title as it will be displayed in the menu.

Content Management Systems

Drupal – Creating Menus and Linking content

In the **Description** field, enter the text that will be displayed when a user hovers over the link.

In the **Parent item** list, choose the menu that should display this item. Note: the menu you want will only appear in this list if you have assigned it to the content type of the node you are editing. See "Before you begin" above.

(Optional) In the **Weight** list, select the relative weight of the link. Click **Save**.

Which module is required to add menu and link the content?

- a. Menu Module
- b. Structure module
- c. Theme module
- d. Content module

Ans. a

In which link the menu has to be linked with content?

- a. Content>Menu
- b. Appearance>Menu
- c. Structure>Content
- d. Menu>Content

Ans. c

Content Management Systems

Drupal – Customizing the output display of the content

Display modes are core features in Drupal. Its one of the site structuring tools.

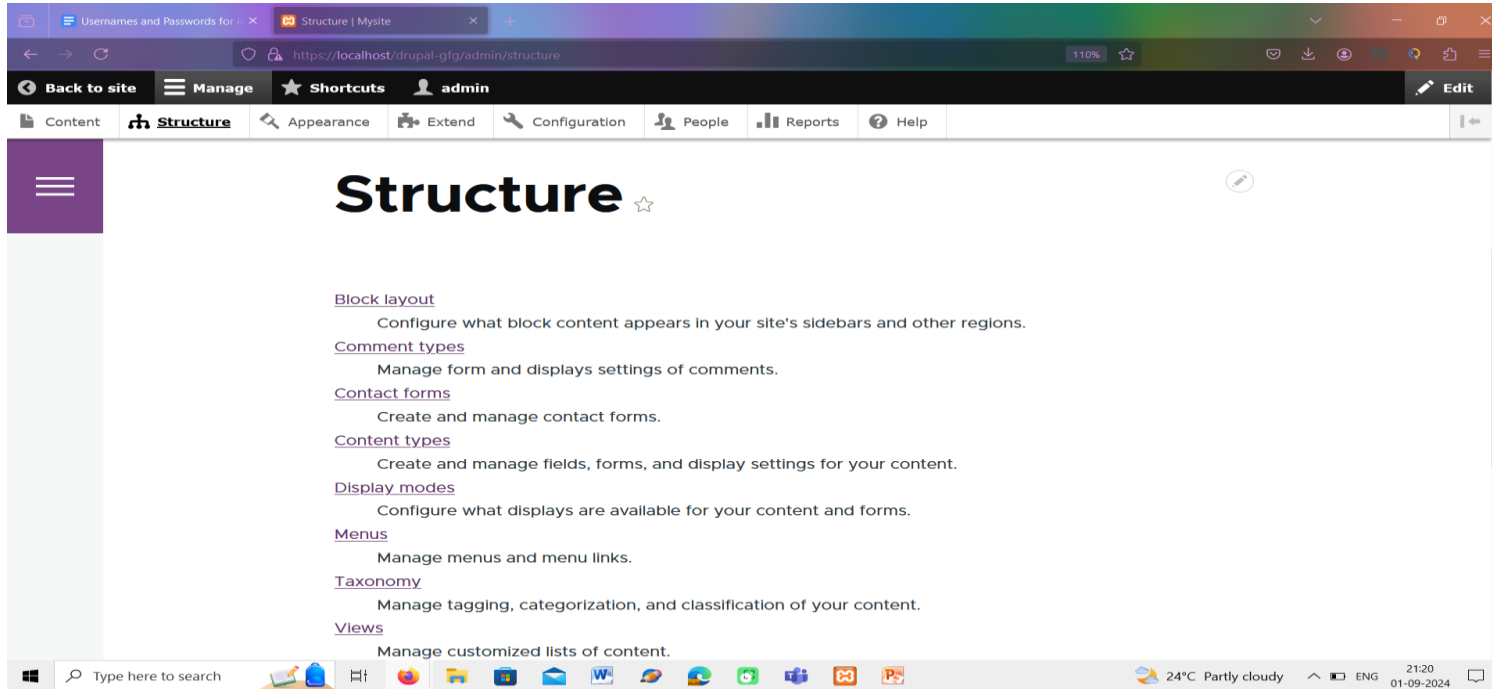

Display modes are configuration entities, can be exported and imported as configuration files.

Display modes are of two types: view modes and form modes.

Content Management Systems

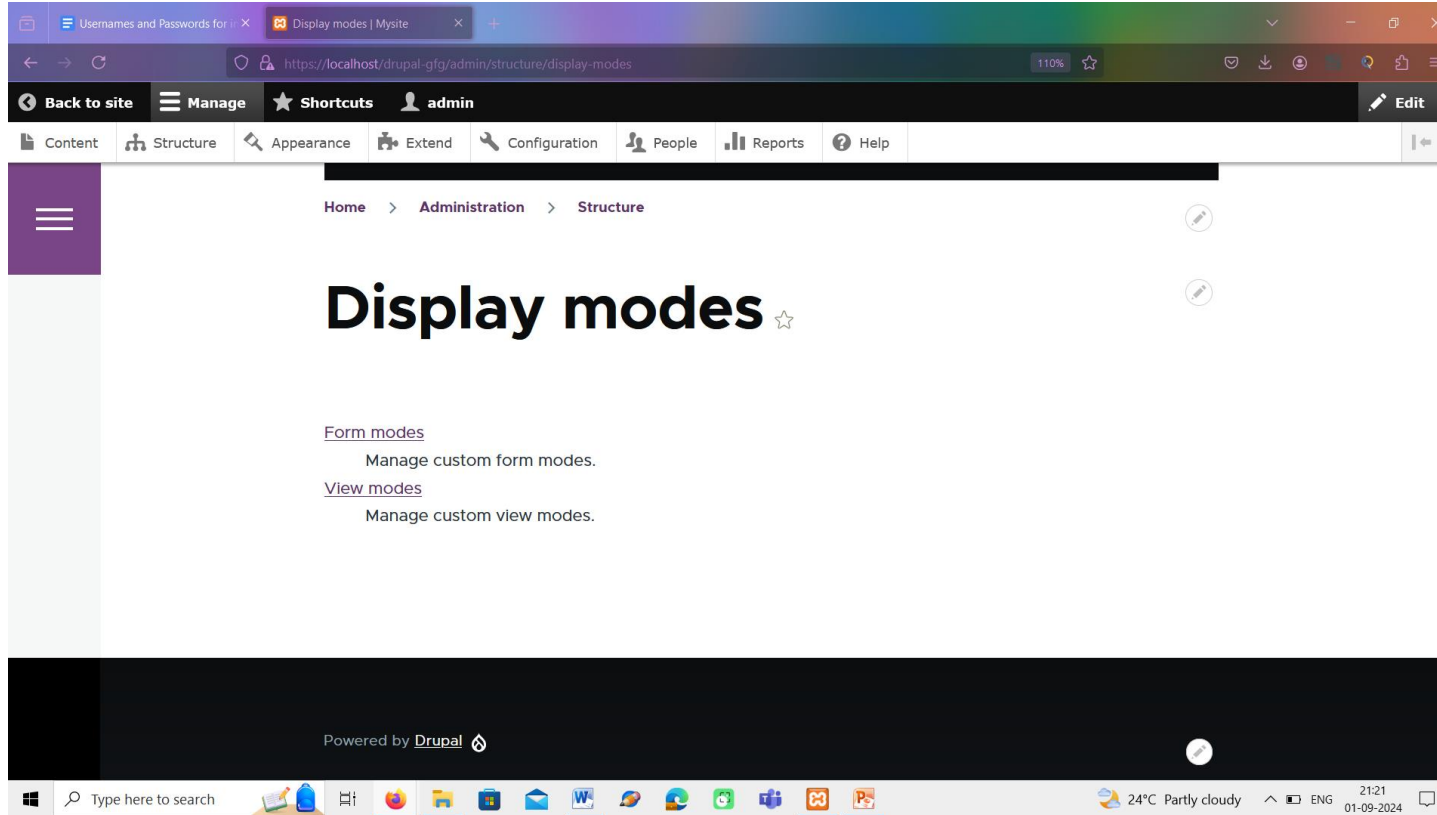

Drupal – Customizing the output display of the content

To go to display modes, click on Structure → Display modes.
The two display modes are View modes and Form modes.

Content Management Systems

Drupal – Customizing the output display of the content

The screenshot displays the Drupal administration interface in a web browser. The address bar shows the URL `https://localhost/drupal-gfg/admin/structure/display-modes`. The top navigation bar includes links for 'Back to site', 'Manage', 'Shortcuts', and 'admin'. Below this, a secondary navigation bar lists various site management sections: Content, Structure, Appearance, Extend, Configuration, People, Reports, and Help. The main content area is titled 'Display modes' and features a breadcrumb trail: 'Home > Administration > Structure'. Under the title, there are two links: 'Form modes' (Manage custom form modes) and 'View modes' (Manage custom view modes). The footer of the interface states 'Powered by Drupal'. The Windows taskbar at the bottom shows the system clock as 21:21 on 01-09-2024, along with weather information (24°C, Partly cloudy) and language settings (ENG).

Content Management Systems

Drupal – Customizing the output display of the content

View Modes

View modes are used in managing displays for content entities like nodes, taxonomy, paragraphy etc.

Renders content and style on different places accordingly improves performance by unnecessary content rendering.

Create your own view modes.

Content Management Systems

Drupal – Customizing the output display of the content

Form modes

Administered in aggregate at: `/admin/structure/display-modes/form`

Enabled per bundle at urls like:

`/admin/structure/types/manage/page/form-display` (where 'page' is a bundle of the node entity)

Content Management Systems

Drupal – Customizing the output display of the content

Like view modes, form modes allow for multiple sets of field widget orderings and customizations, just as view modes allow for different orderings and customization of field formatters. This gives us more flexibility over how things will appear when someone is looking at the add/edit form of any content types.

In addition to content types, we can also manage view modes for other entity types like users, taxonomy, comments, and custom blocks.

Content Management Systems

Drupal – Customizing the output display of the content

Customizing the display output of content

Drupal provides display view modes that allow you to customize the fields and other properties attached to an entity.

In this step, we will adjust the teaser display mode of an Article content type. Each field or property has controls for displaying the label, the format to display the information in, and additional settings for the format.

Content Management Systems

Drupal – Customizing the output display of the content

How to do it...

1. Now, it is time to customize the form display mode by navigating to Structure and then Content Types.
2. We will modify the Article content type's display. Click on the drop button arrow and select Manage display.
3. Click on the Teaser view mode option to modify it. Teaser view mode is used in node listings, such as the default home page.

Drupal – Customizing the output display of the content

4. Drag the Tags field to the hidden section. The tags on an article will no longer be displayed when viewing a Teaser view mode.
5. Click on the settings cog icon for the Body field to adjust the trimmed limit. The trim limit is a fallback for the summary or trimmed format when the summary of a text-area field is not provided. Modify this by changing it from 600 to 300.
6. Click on Save to save all the changes that you have made.
7. View the home page and review the changes that have taken effect.

Content Management Systems

Drupal – Customizing the output display of the content

How it works...

The default rendering system for an entity uses view displays. View display modes are configuration entities.

Since view display modes are configuration entities, they can be exported using configuration management.

Content Management Systems

Drupal – Customizing the output display of the content

When a content entity is rendered, the view display goes through each field formatter configured in the display.

The field formatter is the option chosen from the Format property of the Manage Display form and identifies what code should be used to render the field value.

The field value is retrieved from the entity and passed to the field formatter plugin that has been instantiated with the configuration provided to the view display.

This collection of render data is then passed through the rest of Drupal's render pipeline.

Content Management Systems

Quiz

How many types of display modes are available in Drupal?

- a. 2
- b. 3
- c. 4
- d. 1

Ans. a

What are the display modes available in Drupal?

- a. Form mode and view mode
- b. View mode and structure mode
- c. Form mode and structure mode
- d. View mode and content mode

Ans. a

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Understanding Drupal 10's Layout Builder

Drupal 10's Layout Builder is a powerful tool that gives content editors and site builders the ability to easily and visually create custom layouts for their websites. It's a game-changer for Drupal, making it much easier for non-technical users to create beautiful and engaging pages.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

What is Layout Builder?

Layout Builder is a drag-and-drop interface that allows you to add, arrange, and configure blocks and content fields on a page. You can create different layouts for different content types, individual entities (such as nodes or paragraphs), and even landing pages.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Key Features of Layout Builder

- ☐ Drag-and-drop interface: The intuitive drag-and-drop interface makes it easy to add blocks and content fields to your layout and arrange them in the order you want.
- ☐ Responsive design: Layouts built with Layout Builder are automatically responsive, so they will look great on all devices.
- ☐ Sections and regions: Layouts are made up of sections, which are containers for blocks and content fields. Sections can be arranged in different ways to create different layouts.

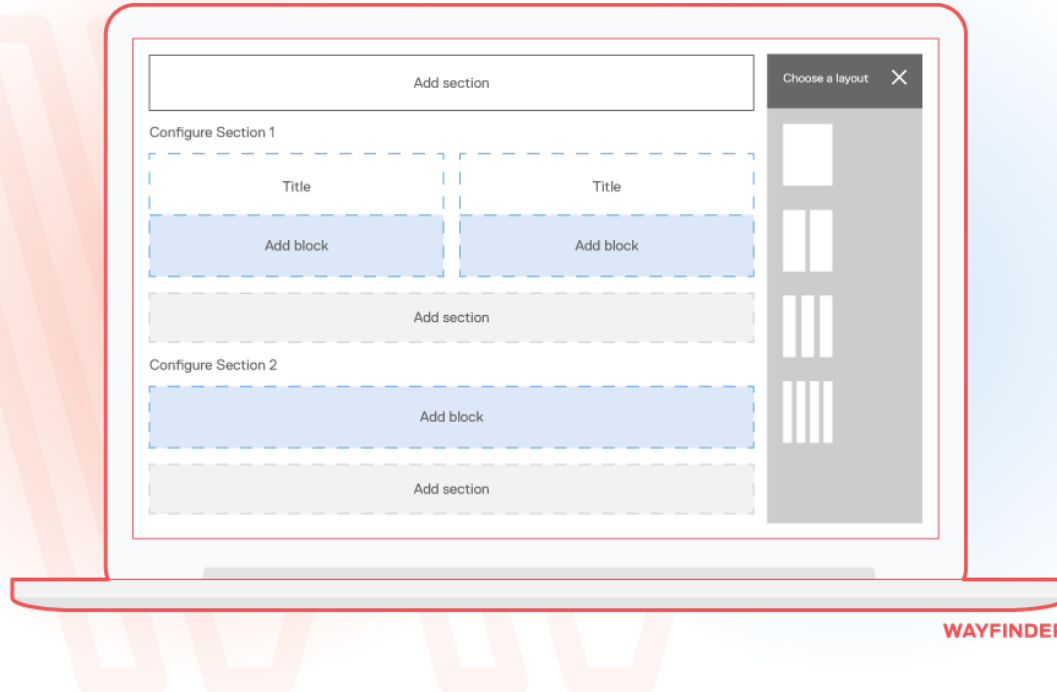

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

- ☐ Block settings: You can configure the settings of each block directly within the Layout Builder interface.
- ☐ Content field placement: You can place content fields from your content type directly into your layout.
- ☐ Inline blocks: You can create custom blocks directly within the Layout Builder interface for one-off details specific to a given layout.
- ☐ Preview mode: You can preview your layout with real content before saving it.

Exploring Layout Builder Sections and Blocks

Sections: The Pillars of Your Layout

Imagine sections as the sturdy pillars of your page structure. They define the main areas of your content, each serving a specific purpose. You can have a section for your hero banner, another for showcasing featured products, and yet another for housing testimonials. Each section acts as a container, holding your desired blocks within its boundaries.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Blocks: The Content Chameleons

Blocks are the versatile chameleons of Layout Builder, bringing your content to life within each section. They can represent anything from text and images to menus, forms, and even custom embeds. Think of them as the individual bricks that fill in the sections, shaping the specific content and functionality you want to offer.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

The beauty of Layout Builder lies in the seamless interplay between sections and blocks. You can:

Drag and drop blocks: Effortlessly rearrange blocks within a section or move them between sections to find the perfect flow.

Configure block settings: Customize individual block appearances and functionalities directly within the Layout Builder interface.

Resize and position sections: Adjust the width and layout of your sections to create a visually balanced and impactful page.

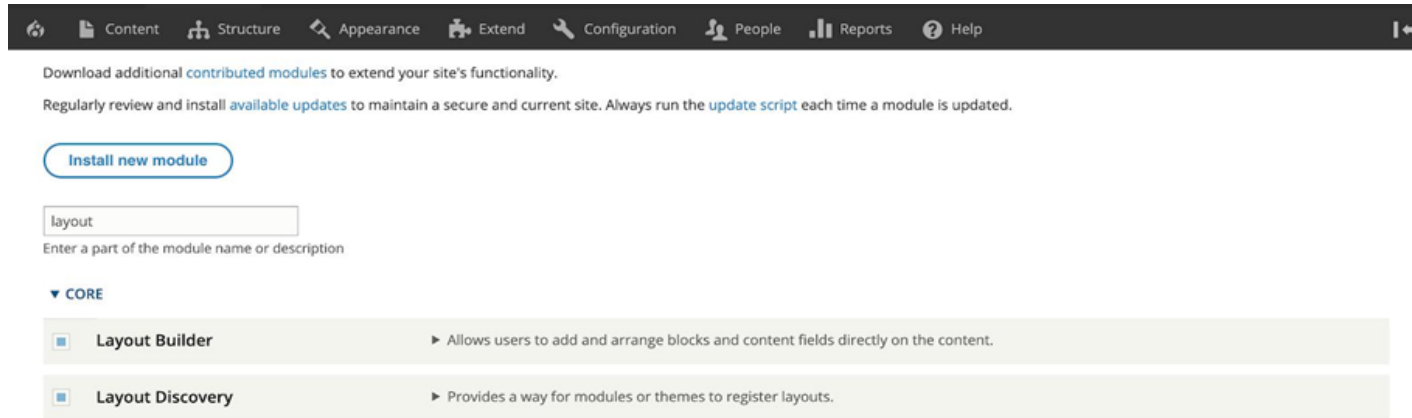

Nesting blocks within sections: Place blocks within other blocks to create intricate layouts and nested content structures.

Installing and setting up the Drupal 9 Layout Builder module

In order to install/setup the Drupal 9 layout builder module, navigate to Extend and enable both Layout Builder and Layout Discovery module.

The screenshot shows the Drupal 9 'Extend' page. At the top, there is a navigation bar with icons for Content, Structure, Appearance, Extend, Configuration, People, Reports, and Help. Below the navigation bar, there is a section titled 'Download additional contributed modules to extend your site's functionality.' followed by a note: 'Regularly review and install available updates to maintain a secure and current site. Always run the update script each time a module is updated.' Below this, there is a button labeled 'Install new module'. Underneath the button, there is a search input field containing the text 'layout'. Below the search field, there is a section titled 'CORE' with a dropdown arrow. Under 'CORE', there are two modules listed: 'Layout Builder' and 'Layout Discovery'. Each module has a checkbox and a description. 'Layout Builder' is described as 'Allows users to add and arrange blocks and content fields directly on the content.' and 'Layout Discovery' is described as 'Provides a way for modules or themes to register layouts.'

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Once you've enabled Layout Builder on the view mode, you can see a “Manage layout” option instead of field formatters. You can use Layout Builder for any of the view modes present.

The screenshot shows the Drupal administration interface for managing the display of 'Article' content. The top navigation bar includes links for Content, Structure, Appearance, Extend, Configuration, People, Reports, and Help. The main heading is 'Manage display'. Below this, there are tabs for 'Edit', 'Manage fields', 'Manage form display', and 'Manage display'. Under the 'Manage display' tab, there are sub-tabs for 'Default', 'RSS', and 'Teaser'. The 'Default' sub-tab is active. The breadcrumb trail is 'Home » Administration » Structure » Content types » Article'. The text explains that content items can be displayed using different view modes: Teaser, Full content, Print, RSS, etc. It notes that 'Teaser' is a short format typically used in lists, while 'Full content' is used when the content is displayed on its own page. It then states: 'Here, you can define which fields are shown and hidden when Article content is displayed in each view mode, and define how the fields are displayed in each view mode.' Below this text, a button labeled 'Manage layout' is highlighted with a red rectangular box. Below the button, there is a section titled 'CUSTOM DISPLAY SETTINGS' with a dropdown arrow. Underneath, there is a section titled 'LAYOUT OPTIONS' with a dropdown arrow. In this section, the option 'Use Layout Builder' is selected with a checked checkbox, and the option 'Allow each content item to have its layout customized.' is unchecked. At the bottom left, there is a blue 'Save' button.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

When you click on “Manage layout”, you will be redirected to article content type layout.

Edit layout for *Article content items*

This layout builder tool allows you to configure the layout of the main content area.

To manage other areas of the page, use the [block administration page](#).

Forms and links inside the content of the layout builder tool have been disabled.

+ Add Section

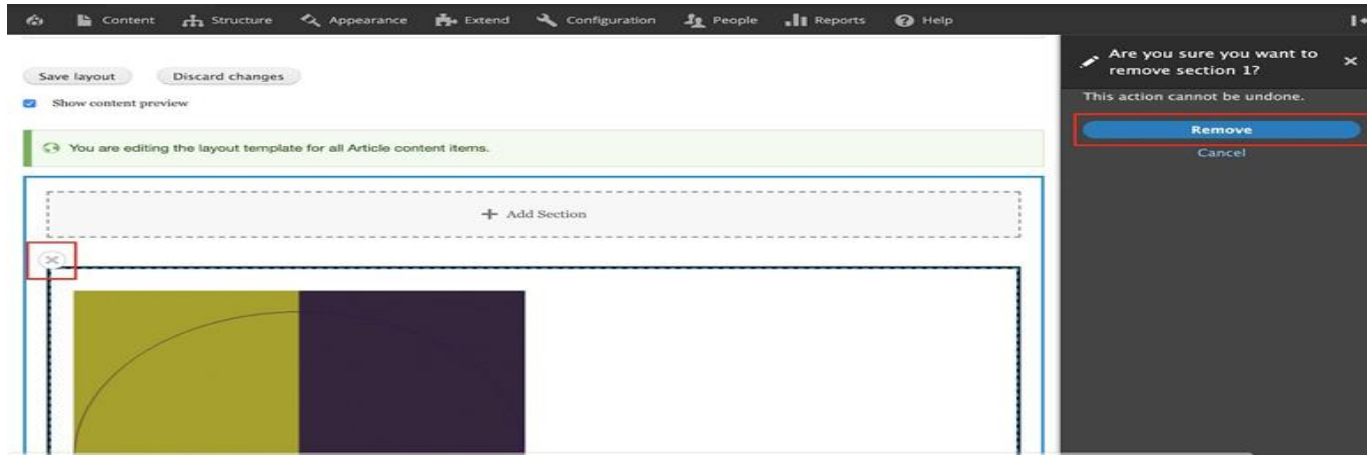

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Add Sections to the Layout

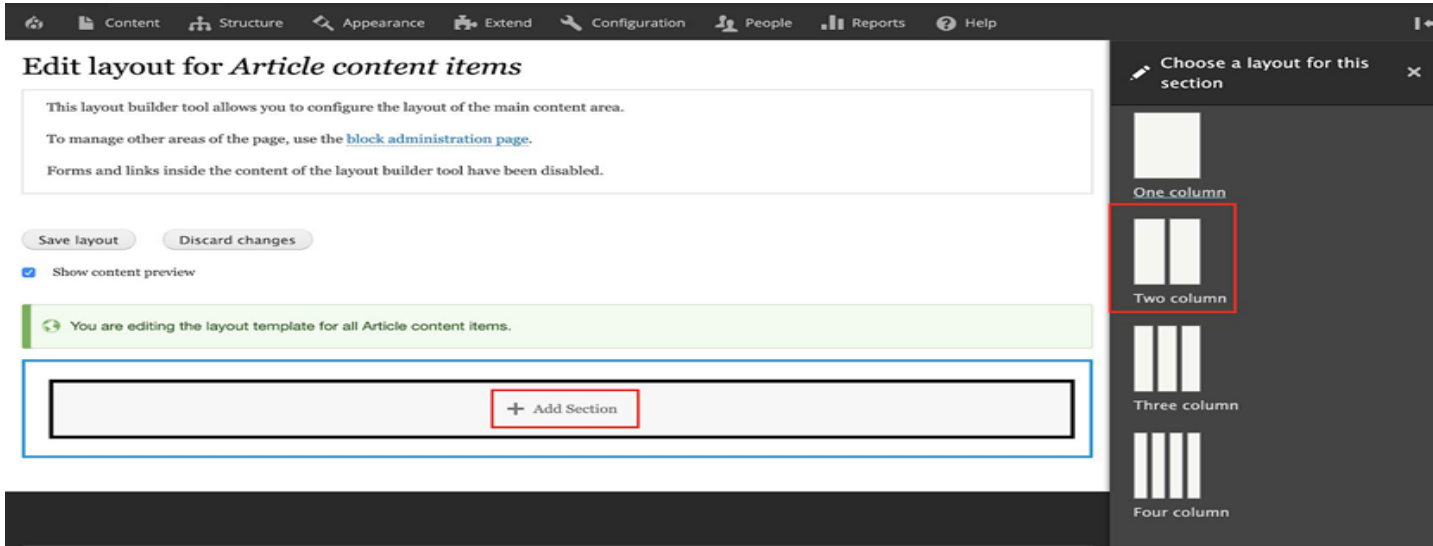

To add sections to the layout builder, remove the default section first. Click on the close icon (as depicted in the below screenshot). Further, you will be provided with an option to the right side of your screen to remove the default section. Click on “Remove”.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Let us add a few sections to our layout by clicking on the “Add Section” option. Further, you will be provided with options to choose a layout of your choice for your section, on the right side of the screen. For now, let us select the “Two Column Section”.

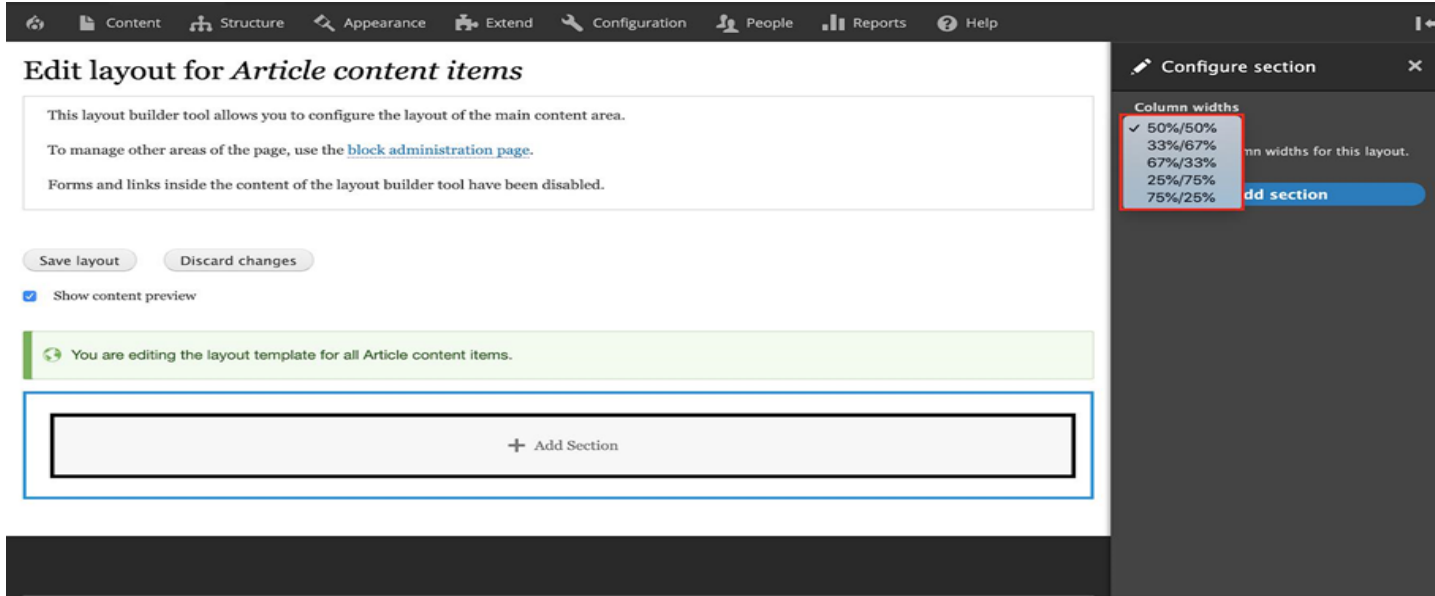

The screenshot displays the Drupal Layout Builder interface for editing the layout of Article content items. The top navigation bar includes links for Content, Structure, Appearance, Extend, Configuration, People, Reports, and Help. The main content area shows instructions for the layout builder tool and buttons for 'Save layout' and 'Discard changes'. A green message bar indicates that the user is editing the layout template for all Article content items. At the bottom, there is a large rectangular area with a red box around the '+ Add Section' button. On the right side, a sidebar titled 'Choose a layout for this section' displays four layout options: 'One column', 'Two column' (highlighted with a red box), 'Three column', and 'Four column'.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

You will have an option to choose the width for your “Two Column Layout”. Let us select a “50%/50%” for now. Then click on “Add section”.

The screenshot shows the Drupal layout builder interface for editing the layout for *Article content items*. The top navigation bar includes links for Content, Structure, Appearance, Extend, Configuration, People, Reports, and Help. The main content area displays instructions for using the layout builder tool, including a link to the [block administration page](#). Below the instructions are buttons for 'Save layout' and 'Discard changes', and a checkbox for 'Show content preview' which is checked. A green status bar indicates 'You are editing the layout template for all Article content items.' The layout area shows a single section with a '+ Add Section' button. On the right, a 'Configure section' sidebar is open, showing a list of column widths: 50%/50% (selected), 33%/67%, 67%/33%, 25%/75%, and 75%/25%. The 'Add section' button is visible at the bottom of the sidebar.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Once added, you should be able to see an “Add Block” link for each section region.

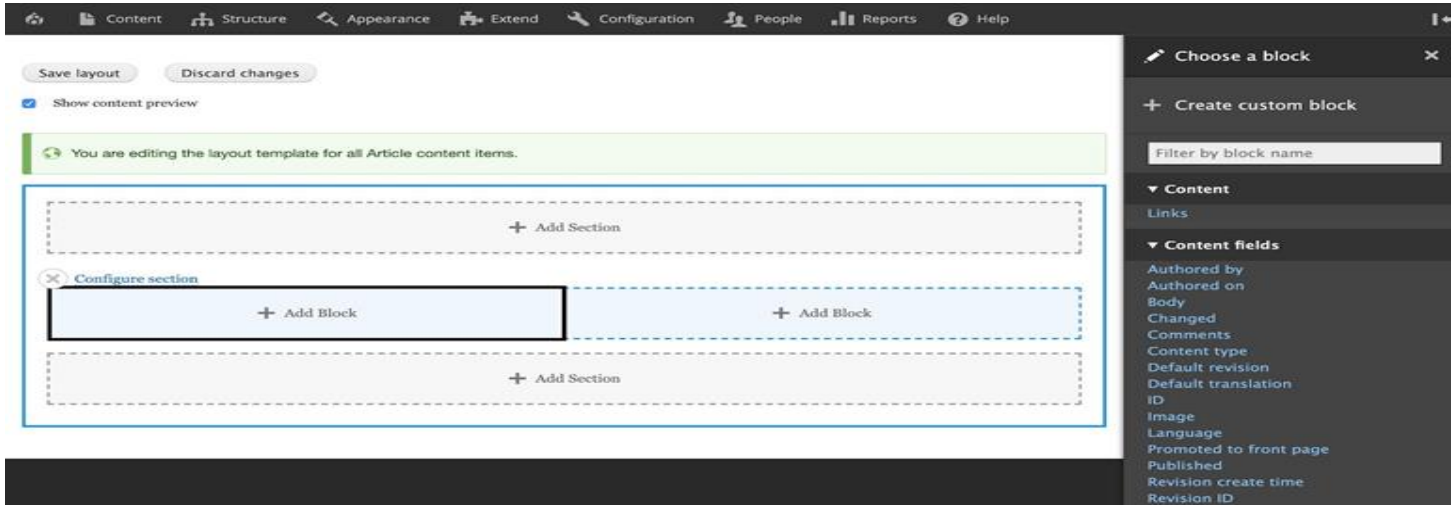

The screenshot displays the Drupal Layout Builder interface. At the top is a navigation bar with icons and labels for Content, Structure, Appearance, Extend, Configuration, People, Reports, and Help. Below this is a message box stating: "Forms and links inside the content of the layout builder tool have been disabled." Underneath are two buttons: "Save layout" and "Discard changes". A checkbox labeled "Show content preview" is checked. A green status bar indicates: "You are editing the layout template for all Article content items." The main layout area is enclosed in a blue border and contains three dashed-line sections. The top and bottom sections are light gray and each has a "+ Add Section" link. The middle section is light blue and is titled "Configure section" with a close icon. It is divided into two columns, each containing a "+ Add Block" link, which are highlighted with red rectangular boxes.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Add Blocks to the Section Regions

After choosing your section for the layout, you can add blocks into your section. To add a block just click on “Add Block” and the “Choose a block” option will slide out from the right.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

The detailed discussion of adding blocks and regions will be done later other chapter.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Layout Builder+

The Layout Builder + module takes the core Drupal Layout Builder and transforms it into a more powerful, intuitive, and user-friendly page builder. It retains the familiar aspects of the core Layout Builder while introducing significant enhancements:

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

User Interface and Experience

WYSIWYG Editing: The clean, intuitive UI mirrors your page's final appearance, offering a true 'What You See Is What You Get' experience.

Enhanced Block Selection: A sidebar filled with visually descriptive block icons allows for easy identification and selection. Additional blocks are just a search or scroll away.

Drag-and-Drop Convenience: Place blocks precisely where you want them with simple drag-and-drop actions.

Auto-Generated Content: Blocks automatically populate with content, providing a realistic preview as you build.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Workflow Efficiency

Reduced Steps for Block Addition: Streamline your workflow with fewer clicks. The intuitive design means you spend less time searching for and configuring blocks.

True-to-Life Editing: The editing interface mirrors the final page, eliminating the need to switch views to see the end result.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Advanced Layout Features

Sortable Sections: Reorder your page layout with ease.

Block Duplication: Efficiently replicate blocks. No need to rebuild several similar blocks. Just duplicate it and tweak the new one!

Nested Layouts: Experience the most intuitive nested layout functionality available. Enter a nested layout, add blocks, and then treat the entire nested layout as a custom block. This approach simplifies managing complex designs.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

'Custom Block' Functionality: Treat nested layouts and their contained blocks as singular custom blocks. This enables easy movement, duplication, and modification – akin to a copy-and-paste workflow.

Section Library Integration: Save your sections and custom blocks and layouts for reuse. Easily apply them to other pages, ensuring consistency and saving time.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Adding Layout Builder+ module

Go to drupal.org → Downloads → modules

Select Layout Builder+ module and click on view releases at the end of the screen.

Download tar.gz version of the file

After downloading, click on link Extend → Add a new module, select the downloaded the module and click on continue or install, once the module get installed

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Click on the enable newly added modules in the next screen,

In the extend link to go the newly added module Layout Builder+ and enable the check box, and click on Install button.

Once the module get installed, go the structure→content types and select the content type article or basic page.

In the operations field, of the article or basic page, click on Manage display and click on Manage Layout.

Content Management Systems

Drupal – Using Layouts to build landing pages in Drupal

Using Layout Builder+ design the blocks and pages as per the requirements.

What is a Layout Builder?

- a. Is a powerful tool that gives content editors and site builders the ability to easily and visually create custom layouts for their websites.
- b. Is a tool that give user interface to design menus and pages
- c. Is a tool that provide various layouts for web pages
- d. None of the above

Ans. A

What is the basic purpose of Layout Builder?

- a. To build menus
- b. To build landing pages
- c. To build structured pages
- d. All of the above

Ans. b

What is the module added to Drupal for designing pages through Layout builder?

- a. Layout Builder 10
- b. Layout builder 9
- c. Layout builder+
- d. Layout builder-

Ans. c
